User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Knowledge Base: What do I need to monitor Dell servers?

- <http://kb.paessler.com/en/topic/45333>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.105 SNMP Dell PowerEdge System Health Sensor

The SNMP Dell PowerEdge System Health sensor monitors the system health of a Dell PowerEdge server using Simple Network Management Protocol (SNMP). It can show the global system status, the power supply status, the temperature status, the cooling device status, the memory device status, the voltage status, and many more, depending on the available components of your device.

This sensor type has predefined limits for several metrics. These limits can be changed individually in the channel settings. For detailed information about channel limits please refer to the section [Sensor Channels Settings](#)<sup>1709</sup>.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1955</sup> section.

### Requirement: Dell OpenManage Server Administrator or iDRAC 7

This sensor needs the Dell OpenManage Server Administrator tool to be installed on the device in order to monitor PowerEdge servers. Please make sure that you enable SNMP in the OpenManage Server Administrator. For details, please see section **More** below. **Note:** You can also monitor Dell PowerEdge servers with this sensor type via Integrated Dell Remote Access Controller (iDRAC) 7.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>2201</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the health status of a Dell PowerEdge server, PRTG will create one sensor for each chassis you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### Dell PowerEdge System Health Specific

##### Chassis

Select the chassis you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Dell PowerEdge System Health Specific	
Chassis	Shows the chassis this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Channel Mask	Shows the channel mask that describes which sensors are available. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Data Source	Shows the interface which is used to get monitoring data. This is either Dell OpenManage Server Administrator (OMSA) or Integrated Dell Remote Access Controller (iDRAC).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: What do I need to monitor Dell servers?

- <http://kb.paessler.com/en/topic/45333>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.106 SNMP Disk Free Sensor

The SNMP Disk Free sensor monitors the free disk space on a logical disk via Simple Network Management Protocol (SNMP). It can show free space in percent and in total, as well as the total space. **Note:** This sensor uses more generic Object Identifier (OID) values compared to the [SNMP Linux Disk Free Sensor](#)<sup>[1122]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1986]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor memory usage, PRTG will create one sensor for each memory type you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Disk Free Settings	
Disk	Select one or more disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Disk Free Settings**

Disk	Shows the name of the disk that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.107 SNMP GSA System Health Sensor

The SNMP GSA System Health sensor monitors the system health of a Google Search Appliance (GSA) via Simple Network Management Protocol (SNMP). It can show the number of queries per minute, the number of processed documents, the number of indexed documents, the number of processed bytes, the activity status of crawling, the crawling rate per second, as well as the health status of disk, temperature, and machine.

**Note:** The location you provide in the GSA's SNMP configuration section will be shown in PRTG's [GeoMaps](#)<sup>[1744]</sup>. In order to use SNMP v3 for monitoring, you need to add an SNMP v3 user in the GSA's SNMP configuration.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1950]</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

##### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.108 SNMP Hardware Status Sensor

The SNMP Hardware Status sensor monitors the status of a hardware component of a server via Simple Network Management Protocol (SNMP). It shows the current status of the component, as well as the number of errors per time period.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor hardware components of a server, PRTG will create one sensor for each component you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Hardware Specific	
Hardware Component	Select the hardware components you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Hardware Specific	
Hardware Component	Shows further information about the hardware component. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Product ID	
Description	
Type	
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"><li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li><li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li></ul>

Sensor Display	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.109 SNMP HP LaserJet Hardware Sensor

The SNMP HP LaserJet Hardware sensor monitors performance counters on a HP LaserJet hardware device using Simple Network Management Protocol (SNMP).

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For devices with multiple performance counters multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Dell Hardware Specific	
Library OIDs	<p>Select the performance counters you want to add a sensor for. A list of available counters for your device is shown with category and name:</p> <ul style="list-style-type: none"><li>▪ <b>Toner/Status</b></li><li>▪ <b>Paper/Status</b></li><li>▪ <b>Jam/Status</b></li></ul> <p>A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.</p>

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

HP LaserJet Specific	
Selected Interface	Shows the name of the interface (performance counter) monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>[1716]</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.110 SNMP HP ProLiant Logical Disk Sensor

The SNMP HP ProLiant Logical Disk sensor monitors a logical disk in an HP server via Simple Network Management Protocol (SNMP). It can show disk status and completion. Completion is only important when the disk status is "Reconstructing" or "Expanding" and illustrates the progress of this task.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1955]</sup> section.

### Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: [HP Insight Management Agents for Windows Server 2003/2008](#). In order to receive SNMP data from RAID controllers you will additionally need [HP Insight Management WBEM Providers](#). For more details and download links please refer to the subsection **More** below.

**Note:** Some of the HP [Object Identifiers \(OIDs\)](#) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the [Agentless Management](#) feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor logical disks in a HP server, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### HP ProLiant Logical Disk Settings

Disk

Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

HP ProLiant Logical Disk Settings	
Disk	Shows the name of the disk that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Knowledge Base: Monitor HP ProLiant via SNMP

- <http://kb.paessler.com/en/topic/33133>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.111 SNMP HP ProLiant Memory Controller Sensor

The SNMP HP ProLiant Memory Controller sensor monitors a memory controller in an HP server via Simple Network Management Protocol (SNMP). It shows the error status of the controller, the condition of the controller, and states and conditions of available modules. **Note:** If modules are inserted at a later point, the sensor has to be added again.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#) <sup>2039</sup>.

For supported lookup values of this specific sensor, please see subsection [More](#) <sup>1053</sup> below.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1955</sup> section.

### Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: **HP Insight Management Agents for Windows Server 2003/2008**. In order to receive SNMP data from RAID controllers you will additionally need **HP Insight Management WBEM Providers**. For more details and download links please refer to the subsection **More** below.

**Note:** Some of the HP **Object Identifiers (OIDs)** which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the **Agentless Management** feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>2201</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor memory controllers in a HP server, PRTG will create one sensor for each controller you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**HP ProLiant Memory Controller Settings**

Controller	Select the controllers you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**HP ProLiant Memory Controller Settings**

Controller	Shows the name of the controller that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.112 SNMP HP ProLiant Network Interface Sensor

The SNMP HP ProLiant Network Interface sensor monitors a network interface in an HP server via Simple Network Management Protocol (SNMP). It can show traffic in and out, the number of transmitted and received good frames, the number of transmitted and received bad frames, alignment and FCS (Frame Check Sequence) errors, late and excessive collisions, carrier sense errors, and when the frames are too long.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: [HP Insight Management Agents for Windows Server 2003/2008](#). In order to receive SNMP data from RAID controllers you will additionally need [HP Insight Management WBEM Providers](#). For more details and download links please refer to the subsection **More** below.

**Note:** Some of the HP [Object Identifiers \(OIDs\)](#) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the [Agentless Management](#) feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor network interfaces in a HP server, PRTG will create one sensor for each interface. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### HP ProLiant Network Interface Settings

##### Network Interface

Select the interfaces you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

**Note:** In the **HP ProLiant Network Interface Settings** section, the **Status** of each available network interface is shown. If this status is **Link Failure**, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface will not work correctly. The error message in this case will be **No Such Name (SNMP error # 2)**.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HP ProLiant Network Interface Settings	
Network Interface	Shows the name of the interface that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## 6.8.113 SNMP HP ProLiant Physical Disk Sensor

The SNMP HP ProLiant Physical Disk sensor monitors a physical disk in an HP server via Simple Network Management Protocol (SNMP). It can show read and written sectors, hard and corrected read errors, hard and corrected write errors, the disk status, the drive condition, the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status, and if the threshold is passed.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1955</sup> section.

### Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: [HP Insight Management Agents for Windows Server 2003/2008](#). In order to receive SNMP data from RAID controllers you will additionally need [HP Insight Management WBEM Providers](#). For more details and download links please refer to the subsection **More** below.

**Note:** Some of the HP [Object Identifiers \(OIDs\)](#) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the [Agentless Management](#) feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor physical disks in a HP server, PRTG will create one sensor for each disk. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### HP ProLiant Physical Disk Settings

##### Disk

Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
HP ProLiant Physical Disk Settings	
Disk	Shows the name of the disk that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

- <http://kb.paessler.com/en/topic/33133>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.114 SNMP HP ProLiant System Health Sensor

The SNMP HP ProLiant System Health sensor monitors the system health of an HP ProLiant server via Simple Network Management Protocol (SNMP). It can show the overall status, the thermal status, the system fan status, the CPU fan status, the number of broken and running fans, as well as the number of broken and running fans that are fault tolerant, and status and condition of the power supply.

Furthermore, it can show several temperatures for various components of an HP ProLiant server—for example: memory, power supply, CPU, system, and storage. It is also possible to display the power consumption and disk controller status. These channels are created at run-time, depending on the available measurement components.

The SNMP HP ProLiant System Health sensor has predefined limits for temperatures and broken frames. These limits can be changed individually in the channel settings. For detailed information about channel limits please refer to the subsection [Channels](#)<sup>1071</sup> below.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1950</sup> section.

### Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: [HP Insight Management Agents for Windows Server 2003/2008](#). In order to receive SNMP data from RAID controllers you will additionally need [HP Insight Management WBEM Providers](#). For more details and download links please refer to the subsection **More** below.

**Note:** Some of the HP [Object Identifiers \(OIDs\)](#) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the [Agentless Management](#) feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>1709</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: Monitor HP ProLiant via SNMP

- <http://kb.paessler.com/en/topic/33133>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.115 SNMP IBM System X Logical Disk Sensor

The SNMP IBM System X Logical Disk sensor monitors a logical disk in an IBM server via Simple Network Management Protocol (SNMP). It shows the status of a logical disk.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1995</sup> section.

### Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section [More](#) below.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the logical disks of an IBM device, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### IBM System X Logical Disk Settings

Disk	Select the logical disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

IBM System X Logical Disk Settings	
Disk	Shows the ID of the logical disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

Sensor Display	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Knowledge Base: What are the requirements to monitor IBM System x?

- <http://kb.paessler.com/en/topic/59393>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.116 SNMP IBM System X Physical Disk Sensor

The SNMP IBM System X Physical Disk sensor monitors a physical disk in an IBM server via Simple Network Management Protocol (SNMP). It shows the status of a physical disk.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1965</sup> section.

### Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section [More](#) below.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the physical disks of an IBM device, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### IBM System X Physical Disk Settings

Disk	Select the physical disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**IBM System X Physical Disk Settings**

Disk	Shows the ID of the physical disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## 6.8.117 SNMP IBM System X Physical Memory Sensor

The SNMP IBM System X Physical Memory sensor monitors the memory modules in an IBM server via Simple Network Management Protocol (SNMP). It shows the condition of a memory module, as well as its power status.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1995]</sup> section.

### Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section **More** below.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the memory modules of an IBM device, PRTG will create one sensor for each module you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IBM System X Physical Memory Settings	
Module	Select the memory modules you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**IBM System X Physical Memory Settings**

Name	Shows further information about the module. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

## 6.8.118 SNMP IBM System X System Health Sensor

The SNMP IBM System X System Health sensor monitors the system health of an IBM device via Simple Network Management Protocol (SNMP). It can show revolutions per minute of fans (or the current percentage of the possible maximum), temperatures of ambient and CPUs, voltage, status of power supplies, and many more, depending on the available measurement components.

**Note:** If the IBM device returns a string in an unexpected format for the percentage of fan revolutions (for example, "offline"), this sensor will show **-1%** in the corresponding channel. You can define a **Down** status for this via [channel limits](#)<sup>[1710]</sup>.

This sensor type has predefined limits for several metrics. These limits can be changed individually in the channel settings. For detailed information about channel limits please refer to the section [Sensor Channels Settings](#)<sup>[1709]</sup>.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1995]</sup> section.

### Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section **More** below.

**Note:** The SNMP IBM System X System Health sensor can also run directly on an Integrated Management Module (IMM) network port and can show the overall health on IMMs.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the system health of an IBM device, PRTG will create one sensor for each measurement you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**IBM System X System Health Specific**

Measurement	Select the measurements you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
-------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**IBM System X System Health Specific**

Source	Shows the source of the measurement. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measurement	Shows the ID of the measurement that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>

By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.119 SNMP interSeptor Pro Environment Sensor

The SNMP interSeptor Pro Environment sensor queries data from a Jakarta interSeptor Pro environmental monitoring system via Simple Network Management Protocol (SNMP). It can monitor temperature and humidity as measured by the Jakarta interSeptor Pro device.

**Note:** In order to monitor an interSeptor Pro device's data with this sensor, you have to add the IP address of your PRTG installation to **Access Control** in the interSeptor Pro control panel. Open the interSeptor Pro web interface, select **InterSeptor Pro Menu | System Configuration | Access Control** for this purpose, and allow access for PRTG's IP address.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the environment via an interSeptor Pro device, PRTG will create one sensor for each measuring point you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

InterSeptor Environment Specific	
Measuring Point	Select the measuring points you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**InterSector Environment Specific**

Name	Shows information about the measurement which this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measuring Point	Shows the measuring point which this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.120 SNMP LenovoEMC Physical Disk Sensor

The SNMP Lenovo Physical Disk sensor monitors a physical disk in a LenovoEMC Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It shows the overall disk status. States of the disk can be **Normal** (sensor status **Up**), **Unknown** and **Foreign** (both with sensor status **Warning**), as well as **Faulted** and **Missing** (both with sensor status **Down**).

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>1995</sup><sub>2039</sub>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1995</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup><sub>220</sub>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor physical disks in a LenovoEMC NAS, PRTG will create one sensor for each disk you select. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### LenovoEMC Physical Disk Settings

Disk	Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**LenovoEMC Physical Disk Settings**

Disk	Shows the disk monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the disk monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the disk monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>

New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.121 SNMP LenovoEMC System Health Sensor

The SNMP LenovoEMC System Health sensor monitors the system health of a LenovoEMC Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It shows the overall status of the RAID. States can be **Normal** (sensor status **Up**), **Unknown**, **Rebuilding**, **Degraded**, and **RebuildFS** (all with sensor status **Warning**), as well as **Faulted** (sensor status **Down**).

Furthermore, this sensor can show, for example, states of several fans, voltages, and temperatures. These channels are created at run-time depending on the available measurement components in the LenovoEMC NAS.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1950</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.122 SNMP Library Sensor

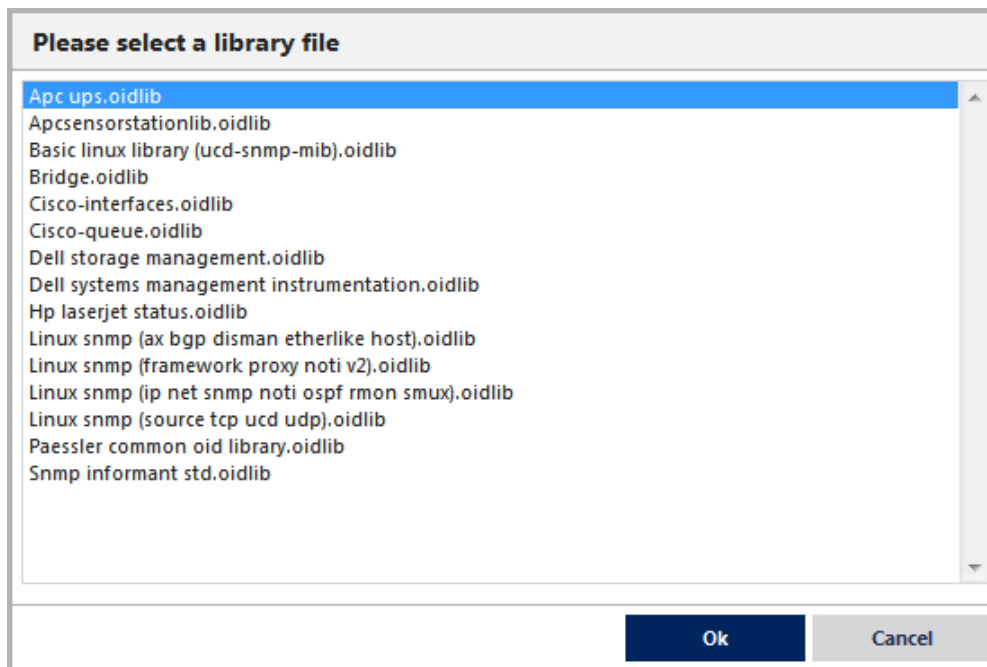

The SNMP Library sensor monitors a device using Simple Network Management Protocol (SNMP) in combination with a compiled Management Information Base (MIB) library file. This provides extended monitoring beyond the standard SNMP sensors of PRTG.

In order to monitor any SNMP capable device, you can download the manufacturer's MIB files for these devices, convert them to the Paessler **oidlib** format, and import them into PRTG. To make your monitoring setup as convenient as possible, PRTG is delivered with pre-compiled **oidlib** library files that already contain the Object Identifier (OID) of SNMP counters for the most common devices in a network.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

### Add Sensor

[Manually add](#) <sup>220</sup> a new sensor to an SNMP device and from the **Add Sensor** dialog, select **SNMP Library** sensor. PRTG will show a list of **oidlib** files available on the system. This contains all library files stored at the **\snmplibs** sub-directory of your PRTG installation directory—both the ones delivered with PRTG and your own files. For details about directory paths, please see section [Data Storage](#) <sup>2074</sup>.

List of SNMP Library Files

The file names in the list indicate the potential purpose. Select a name that appears appropriate for your device and confirm with the **OK** button. Often, **Paessler common oid library.oidlib** is a good start. If the file does not fit to your device, this will result in an error message saying that **the scan for available monitoring items has failed** on this device: **No such object (SNMP error # 222)**. If you see this message, please hit the **Cancel** button and try adding the sensor with another file. If counters were found for your device, you will see the sensor's settings.

## Default OIDLIB Files Overview

The following files are delivered with PRTG and allow to extend your SNMP monitoring for many devices. Please be aware that not all devices and/or parameters may be supported by the libraries.

- **APC UPS.oidlib**  
Can be used to monitor uninterruptible power supplies (UPS) from APC American Power Conversion Corp.
- **APCSensorstationlib.oidlib**  
Can be used to monitor alarm status, communication status, humidity, and temperature as shown by an APC sensor station.
- **Basic Linux Library (UCD-SNMP-MIB).oidlib**  
Can be used to monitor basic system parameters on Linux systems, such as memory, disk and swap, CPU, etc.
- **cisco-interfaces.oidlib**  
Can be used to monitor Cisco specific parameters, for example, the number of present network interfaces on a system, several states of an interface (admin, oper, speed, type, errors, discards, etc.), and more.
- **cisco-queue.oidlib**  
Can be used to monitor queues on a Cisco interface, for example, queue depth and its maximum, discarded messages from the queue, the number of the queue within the queue set, etc.
- **Dell Storage Management.oidlib**  
Can be used to monitor Dell storage devices. Possible parameters include disk arrays, battery and power supply, fan and temperature, virtual disk, etc.
- **Dell Systems Management Instrumentation.oidlib**  
Can be used to monitor the hardware of Dell systems. Possible parameters include ACPower and battery, alerts, base board, Bios, BMC, chassis, COO, cooling, event log, firmware, IDE, keyboard, memory, port, network, processor, SCSI, system, temperature, USB, UUID, etc.
- **Linux SNMP (AX BGP DisMan EtherLike Host).oidlib**  
Can be used to monitor different aspects of Linux systems. **Note:** This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.

- **Linux SNMP (Framework Proxy Not i v2).oidlib**  
Can be used to monitor different aspects of Linux systems. **Note:** This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (IP Net SNMP Not i OSPF RMON SMUX).oidlib**  
Can be used to monitor different aspects of Linux systems. **Note:** This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.
- **Linux SNMP (Source TCP UCD UDP).oidlib**  
Can be used to monitor different aspects of Linux systems. **Note:** This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.
- **Paessler Common OID Library.oidlib**  
Can be used to monitor many common hardware devices. It is used for several sensors and is encrypted.

## Import MIB Files

Additionally you can create your own **oidlib** files by importing your device manufacturers' MIB files, using a the free Paessler **MIB Importer**. Simply convert your **mib** files and save the resulting **oidlib** files to the **\snmplibs** sub-folder of your PRTG program directory. For details about directory paths, please see [Data Storage](#)<sup>2074</sup>. For more information and download of **MIB Importer**, please see the link in the [More](#)<sup>1120</sup> section below.

## SNMP Library Sensor—Add Sensor Settings

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SNMP Library Specific	
Library	This shows the path to the <b>oidlib</b> file selected before. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Library-OIDs	Select the aspects of the device you want to monitor. A list specific to your setup is shown. It contains all counters found in the chosen library that match your device. Select one or more items by adding a check mark in front of the respective line. For each selection one sensor will be created when you click the <b>Continue</b> button.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SNMP Library Specific	
Selected Interface	Shows the interface monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Enter a string describing the unit of the returned values. This is for display purposes only. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the quotient here. Please enter an integer or float value, or leave the field empty.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer or float value, or leave the field empty.
If Value Changes	<p>Define what will be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <small>1716</small> whenever the sensor value changes.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## More

Knowledge Base: How can I import my MIB files into PRTG?

- <http://kb.paessler.com/en/topic/733>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.123 SNMP Linux Disk Free Sensor

The SNMP Linux Disk Free sensor monitors free space on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP). It shows the total free disk space (sum), and the free disk space in percent for every mounted partition (volume).

**Note:** The free space returned by this sensor type shows the disk space that is not yet used. Not all of this space may be available for use, as a part of this space can be reserved by the system, e.g. for redundancy purposes. For details, please see the article linked in the [More](#) <sup>1129</sup> section below.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1955</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Set limits checked against ALL disks**

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status; depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor's **Channels** settings. **Note:** All limits defined here are valid additionally to the limits defined in the particular **Channels** settings!

Percentage Limit Check	<p>Enable or disable a limit check for the free space in percentage channels of all drives. By default percentage limits are enabled with lower warning and lower error limit. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Percentage Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Percentage Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when free space limits are undercut or overrun.</li> </ul>
Upper Error Limit	<p>This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Down</b> status. If the free disk space of one of your drives overruns this percent value, the sensor will be set to <b>Down</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>1709</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Upper Warning Limit	<p>This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Warning</b> status. If the free disk space of one of your drives overruns this percent value, the sensor will be set to <b>Warning</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>1709</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Lower Warning Limit	<p>This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for a warning state. If the free disk space of one of your drives undercuts this percent value, the sensor will be set to warning. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>1709</sup>. The limits set here and in the channel settings are valid simultaneously!</p>

Set limits checked against ALL disks	
Lower Error Limit	This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for entering a <b>Down</b> status. If the free disk space of one of your drives undercuts this percent value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Byte Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Byte Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Byte Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when free space limits are undercut or overrun.</li> </ul>
Upper Error Limit	This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!

**Set limits checked against ALL disks**

Lower Error Limit	This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Deactivate alarm (default):</b> Select this option if you do not want an alarm for a removed disk.</li> <li>▪ <b>Activate Alarm:</b> Select this option if you want to be alerted if a monitored disk is removed.</li> </ul>

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Channel Unit Configuration

### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

Knowledge Base: Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?

- <http://kb.paessler.com/en/topic/43183>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.124 SNMP Linux Load Average Sensor

The SNMP Load Average sensor monitors the system load average of a Linux/Unix system using Simple Network Management Protocol (SNMP). It shows the average system load within a one, five, and 15 minutes interval (each in one channel).

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol

Sensor Display	
	of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.125 SNMP Linux Meminfo Sensor

The SNMP Linux Meminfo sensor monitors the memory usage of a Linux/Unix system using Simple Network Management Protocol (SNMP). It shows the available memory in total and in percent.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol

Sensor Display	
	of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.126 SNMP Linux Physical Disk Sensor

The SNMP Linux Physical Disk sensor monitors input/output (I/O) on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP). It shows read and written bytes per second, read and write accesses per second, as well as load average within a specific time span (1, 5, and 15 minutes), depending on the counters available on the disk.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor I/O on disks of a Linux/Unix system, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Physical Disk Settings	
Disk	Select one or more disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Physical Disk Settings**

Disk	Shows further information about the disk that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Bitmask	

**Set limits checked against ALL disks**

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status; depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor's **Channels** settings.

**Note:** All limits defined here are valid additionally to the limits defined in the particular **Channels** settings!

Percentage Limit Check	<p>Enable or disable a limit check for load average in percentage channels of all drives. By default percentage limits are enabled with lower warning and lower error limit. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Percentage Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Percentage Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when load average limits are undercut or overrun.</li> </ul>
------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Set limits checked against ALL disks	
Upper Error Limit	This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Down</b> status. If load average of one of your drives overruns this percent value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Warning</b> status. If load average of one of your drives overruns this percent value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for a warning state. If load average of one of your drives undercuts this percent value, the sensor will be set to warning. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for entering a <b>Down</b> status. If load average of one of your drives undercuts this percent value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Byte Limit Check	<p>Enable or disable a limit check for read and written bytes channels of all drives. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Byte Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Byte Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when read and written bytes limits are undercut or overrun.</li> </ul>

Set limits checked against ALL disks	
Upper Error Limit	This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the bytes channels of this sensor (by default this is MByte). If the read and/or written bytes of one of your drives overruns this bytes value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the bytes channels of this sensor (by default this is MByte). If the read and/or written bytes of one of your drives overruns this bytes value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the bytes channels of this sensor (by default this is MByte). If the read and/or written bytes of one of your drives undercuts this bytes value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the bytes channels of this sensor (by default this is MByte). If the read and/or written bytes of one of your drives undercuts this bytes value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> . The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	<p>If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Deactivate alarm (default):</b> Select this option if you do not want an alarm for a removed disk.</li> <li>▪ <b>Activate Alarm:</b> Select this option if you want to be alerted if a monitored disk is removed.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.127 SNMP Memory Sensor

The SNMP Memory sensor monitors the memory usage of a system via Simple Network Management Protocol (SNMP). It can show the available memory in total and in percent, as well as the total memory. **Note:** This sensor uses more generic Object Identifier (OID) values compared to the [SNMP Linux Meminfo Sensor](#)<sup>1135</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1936</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor memory usage, PRTG will create one sensor for each memory type you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Memory Settings	
Memory	Select one or more memory types you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Memory Settings**

Memory	Shows the type of the memory that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.128 SNMP NetApp Disk Free Sensor

The SNMP NetApp Disk Free sensor monitors free space on disks of a NetApp storage system via Simple Network Management Protocol (SNMP). It can show deduplication saved space and shared space, in total and in percent; disk free (total and percent), as well as percentage values for files free and inodes free.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor disk space on a NetApp, PRTG will create one sensor for each disk. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NetApp Disk Free Settings	
File System	Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

NetApp Disk Free Settings	
File System	Shows the name of the disk that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Virtual Disk	Shows the name of the virtual disk that this sensor is monitoring (if applicable). Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.  <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.129 SNMP NetApp Enclosure Sensor

The SNMP NetApp Enclosure sensor monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via SNMP. It can measure temperatures, fans, voltages, and currents.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor power supply and cooling of an enclosure on a NetApp, PRTG will create one sensor for each enclosure/measurement combination. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NetApp Enclosure Settings	
Enclosure	Select the enclosures with the desired measurement you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**NetApp Enclosure Settings**

Enclosure	Shows the identifier of the enclosure that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measurement	Shows the monitored measurement. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.  <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.130 SNMP NetApp I/O Sensor

The SNMP NetApp I/O sensor monitors input/output operations (IOPS) on a NetApp storage system via Simple Network Management Protocol (SNMP). It can show FCP Read, CIFS Ops, Disk Read, Disk Write, FCP Ops, FCP Write, HTTP Ops, iSCSI Ops, iSCSI Read, iSCSI Write, Network Received, Network Sent, NFS Ops, Tape Read, and Tape Write.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.131 SNMP NetApp License Sensor

The SNMP NetApp License sensor monitors the licenses for the services of a NetApp storage system via Simple Network Management Protocol (SNMP). It indicates how much time is left until the license for a service expires. This can help you to detect when a timely limited NetApp license is going to expire.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor licenses on a NetApp, PRTG will create one sensor for each license. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NetApp License Settings	
License for Service	Select the licenses you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**NetApp License Settings**

License for Service	Shows the name of the license that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
---------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.132 SNMP NetApp Logical Unit Sensor

The SNMP NetApp Logical Unit sensor monitors the input/output operations (IOPS) on a logical unit of a NetApp storage system via Simple Network Management Protocol (SNMP). It can show the total number of operations, the amount of read and written data, the number of errors, the number of read, write, and other operations, as well as the overall status of the logical unit.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor logical units on a NetApp, PRTG will create one sensor for each unit. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### NetApp Disk Free Settings

Logical Unit

Select the logical units you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**NetApp Disk Free Settings**

Logical Unit	Shows the name of the logical unit that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.133 SNMP NetApp Network Interface Sensor

The SNMP NetApp Network Interface sensor monitors a network card of a NetApp storage system via Simple Network Management Protocol (SNMP). It can show traffic in and out, as well as the number of errors per second (in and out).

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1955</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor network interfaces on a NetApp, PRTG will create one sensor for each interface. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### NetApp Network Interface Settings

Network Interface

Select the interfaces you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**NetApp Network Interface Settings**

Network Interface	Shows the name of the interface that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.134 SNMP NetApp System Health Sensor

The SNMP NetApp System Health sensor monitors the status of a NetApp storage system via Simple Network Management Protocol (SNMP). It can show the CPU load in percent, active restore, current CIFS users; the number of disks active, being added, being scrubbed, failed, failing soon, being out of date, reconstructing (parity), spare, verifying parity, and total; the number of fans and power supplies failed; the max used disk space and max used inodes, in percent. This depends on the available measurement components on the NetApp.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.135 SNMP Poseidon Environment Sensor

The SNMP Poseidon Environment sensor monitors performance counters for environmental measurements on Poseidon hardware via Simple Network Management Protocol (SNMP). It can show, for example, humidity and temperature in the environment, depending on available measurement components on the hardware device.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1986</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor performance counters for environmental measurements on Poseidon hardware, PRTG will create one sensor for each measuring point you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Poseidon Environment Specific	
Measuring Point	Select the measurements you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Poseidon Environment Specific**

Name	Shows further information about the measurement. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit	
Measuring Point	

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.136 SNMP Printer Sensor

The SNMP Printer sensor is a generic sensor which monitors various types of printers via Simple Network Management Protocol (SNMP). It can show the total number of printed pages, the fill level of cartridges and toners, and the status of the printer cover. Additionally, the sensor shows the printer status as sensor message.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1955]</sup> section.

**Important notice:** Currently, this sensor type is in **beta** status. The methods of operating can change at any time, as well as the available settings. **Do not expect** that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>  . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.137 SNMP QNAP Logical Disk Sensor

The SNMP QNAP Logical Disk sensor monitors a logical disk in a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It can show free space and free bytes, as well as the status of a volume.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1995]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the logical disks in a QNAP NAS, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

QNAP NAS Settings	
Disk	Select the logical disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**QNAP NAS Settings**

Disk	Shows further information about the disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
File System	

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.138 SNMP QNAP Physical Disk Sensor

The SNMP QNAP Physical Disk sensor monitors a physical disk in a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It can show the temperature, the HD status, and the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status of the disk.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#) <sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1955</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the physical disks in a QNAP NAS, PRTG will create one sensor for each disk you choose. You can also define the unit of the temperature measurement. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

QNAP NAS Settings	
Disk	Select the physical disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
Unit	Select the unit of the temperature measurement. Choose between <b>Celsius</b> and <b>Fahrenheit</b> .

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
138 SNMP QNAP Physical Disk Sensor

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

QNAP NAS Settings	
Disk	Shows further information about the disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
Model	
Capacity	
Unit	

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li><b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.139 SNMP QNAP System Health Sensor

The SNMP QNAP System Health sensor monitors the system health of a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It can show the usage of the CPU, available memory in absolute numbers and percent, the temperature of CPU and system, as well as various other values, for example, revolutions of fans per minute, depending on the available measurement components.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>[198]</sup> section.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the system health of a QNAP NAS, please specify the unit of the temperature measurement.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

QNAP NAS Settings	
Unit	Select the unit of the temperature measurement. Choose between <b>Celsius</b> and <b>Fahrenheit</b> .

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### QNAP NAS Settings

Unit	Shows the unit of temperatures as monitored with this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>1421</sup> section.

## 6.8.140 SNMP RMON Sensor

The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via Simple Network Management Protocol (SNMP). It can be created on an SNMP compatible device which provides traffic data via RMON. Depending on the data returned by your device, traffic data for each port can be displayed in different channels, allowing detailed analysis.

For example, available channels for each traffic port may include Transmitted kbit/s, Packets (#/s), Broadcast Packets (#/s), Multicast Packets (#/s), CRC Errors (#/s), Undersize Packets (#/s), Oversize Packets (#/s), Fragments (#/s), Jabbers (#/s), Collisions (#/s), Packets <= 64 Byte (#/s), Packets 65 - 127 Bytes (#/s), Packets 128 - 255 Bytes (#/s), Packets 256 - 511 Bytes (#/s), Packets 512 - 1023 Bytes (#/s), Packets 1024 - 1518 Bytes (#/s), and Drop Events (#/s).

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>1955</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For SNMP devices with multiple interfaces multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### RMON Specific

##### Ports

Select the ports you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

In the **In Use** column you will see a **Yes** if there was already traffic detected on this interface in the past, and a **No** if there wasn't any traffic yet on this interface (since last device restart, usually). The **In Use** column does **not** show whether or not an interface is currently connected!

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>1709</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
RMON Specific	
Port	Shows the number of the interface port in your physical device that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.  <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.141 SNMP SonicWALL System Health Sensor

The SNMP SonicWALL System Health sensor monitors health values of a Dell SonicWALL Network Security Appliance (NSA) via Simple Network Management Protocol (SNMP). It shows usage of CPU and memory, as well as usage of the connection cache.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) <sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol

Sensor Display	
	of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.142 SNMP SonicWALL VPN Traffic Sensor

The SNMP SonicWALL VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) Virtual Private Network (VPN) on a Dell SonicWALL Network Security Appliance (NSA) via Simple Network Management Protocol (SNMP). It can show the number of encrypted and decrypted packets, the number of bytes of encrypted and decrypted transmissions, as well as the number of in- and outgoing fragmented packets.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#) section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#). It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the traffic of a SonicWALL VPN, PRTG will create one sensor for each connection you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SonicWALL VPN Specific	
Connections	Select the connections you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
Identification Method	<p>Select the criteria PRTG will use to identify the connection. PRTG will always use the first connection found that matches all criteria. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>By Index:</b> Every connection has a unique index. This is the safest method to identify your connection. Though, if the connection is lost and reconnected, a new index will be assigned.</li> <li>▪ <b>By Remote IP:</b> If the target of the VPN has always the same IP, you can use this IP to identify the connection.</li> <li>▪ <b>By Security Policy Name:</b> If you use a different Security Policy for every VPN, you can use its name to identify the connection.</li> <li>▪ <b>By Remote IP and Security Policy Name:</b> You can also combine both identification methods.</li> </ul>

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### SonicWALL VPN Specific

Security Policy	Shows further information about the monitored connection. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Remote IP	
Index	
Identification Method	

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>
Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Channel Unit Configuration

### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.143 SNMP Synology Logical Disk Sensor

The SNMP Synology Logical Disk sensor monitors a logical disk in a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It can show the status of a volume.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1995</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the logical disks in a Synology NAS, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### Synology NAS Settings

Disk	Select the logical disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

### Basic Sensor Settings

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Synology NAS Settings

Disk	Shows further information about the disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.144 SNMP Synology Physical Disk Sensor

The SNMP Physical Disk sensor monitors a physical disk in a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It can show temperature and disk status.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>[1995]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the physical disks in a Synology NAS, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Synology NAS Settings	
Disk	Select the physical disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Synology NAS Settings**

Disk	Shows further information about the disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	
Model	
Type	

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

### Sensor Display

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.
------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.145 SNMP Synology System Health Sensor

The SNMP Synology System Health sensor monitors the system health of a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP). It can show temperature, system status, power status, fan status, as well as several other values, depending on the available measurement components.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1955</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the system health of a Synology NAS, please specify the unit of the temperature measurement.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Synology NAS Settings	
Unit	Select the unit of the temperature measurement. Choose between <b>Celsius</b> and <b>Fahrenheit</b> .

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

### Basic Sensor Settings

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Synology NAS Settings

Unit	Shows the unit of temperatures as monitored with this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.146 SNMP System Uptime Sensor

The SNMP System Uptime sensor monitors the time a device is running via Simple Network Management Protocol (SNMP). It reads the device's value for system uptime and shows it.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a>  from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

#### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
-----------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Sensor Display	
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.147 SNMP Traffic Sensor

The SNMP Traffic sensor monitors traffic on a device using Simple Network Management Protocol (SNMP). It can be created on a device which provides traffic data. For each individual port one traffic sensor is created. It can show traffic in, traffic out, and traffic total. Additional channels can be added.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)  section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) . It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For SNMP devices with multiple interfaces multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Traffic Specific	
Interface Number	Select the interfaces you want to add a sensor for. A list of SNMP device interfaces is shown; containing all interfaces which your device provides. Connected interfaces are printed in bold face; not connected in non-bold face. One sensor will be created for each interface. You can group-select and -unselect interfaces by using the buttons <b>Select all connected interfaces</b> , <b>Select all disconnected interfaces</b> , and <b>Deselect all interfaces</b> . You can also select and deselect all items by using the check box in the table head.
Description IN	For the standard channel "Traffic In" enter the description here. It will be shown in graphs and tables. You can change this description and the description of all other channels in the sensor's <a href="#">channel settings</a>  later.
Description OUT	For the standard channel "Traffic Out" enter the description here. It will be shown in graphs and tables. You can change this description and the description of all other channels in the sensor's <a href="#">channel settings</a>  later.
Description SUM	For the standard channel traffic "Sum" enter the description here. It will be shown in graphs and tables. You can change this description and the description of all other channels in the sensor's <a href="#">channel settings</a>  later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Traffic Specific	
Interface Number	Shows the number and name of the interface in your physical device that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Additional Channels	<p>By default, the channels "Traffic In" and "Traffic out" are created for each sensor. Choose additional channels for all selected interfaces. Please click on the respective channel name(s); a check mark symbol will appear in front of them. You can choose from the following additional channels:</p> <ul style="list-style-type: none"> <li>▪ <b>Errors In &amp; Out</b></li> <li>▪ <b>Discards In &amp; Out</b></li> <li>▪ <b>Unicast Packets In &amp; Out</b></li> <li>▪ <b>Non Unicast Packets In &amp; Out (32-bit only)</b></li> <li>▪ <b>Multicast Packets In &amp; Out (64-bit only)</b></li> <li>▪ <b>Broadcast Packets In &amp; Out (64-bit only)</b></li> <li>▪ <b>Unknown Protocols</b></li> </ul> <p>Channels that are once created cannot be deleted later. They can be disabled only.</p>
Connection Status Handling	<p>Define how PRTG will react when an interface is operational. A interface which is not operational is, for example, an ethernet port on a switch with no cable plugged in. This setting is valid for all interfaces selected above. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Show alarm for all "disconnected" states:</b> The sensor for the interface will always turn into a red error status for a disconnected interface. This applies if the <b>ifOperStatus</b> of the interface is not "up".</li> <li>▪ <b>Show alarm when disconnected, but ignore when deactivated:</b> The sensor will go into an error status for a disconnected interface only if it is not deliberately deactivated in the configuration. This applies if the <b>ifOperStatus</b> of the interface is not "up" and the <b>ifAdminStatus</b> is "up".</li> <li>▪ <b>Ignore all "disconnected" states:</b> No alarm will be shown in PRTG; the sensor status remains green and monitoring will be discontinued without notice.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) 224 group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <small>1839</small> .

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: How do PRTG's automatic port name and number updates work for SNMP traffic sensors?

- <http://kb.paessler.com/en/topic/25893>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.148 SNMP Trap Receiver Sensor

The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps. It shows the overall number of received traps per second, warning and error traps per second, as well as the number of dropped packets per second.

With the available filter options, you can define individually which types of messages will be considered for monitoring, and which messages will be recognized as warning or error messages. Depending on the filters, received messages will be counted in the respective channels.

You can add the sensor to the probe device on the one hand; then the sensor will receive all messages of the system running the probe. Alternatively, you can add the sensor to a specific device to gain all messages from this device directly; this will make this sensor type faster than just using source filters.

**Note:** You can copy the Management Information Base (MIB) file for your traps into the **\MIB subfolder of your PRTG installation** <sup>2074</sup>. PRTG will then be able to translate the OIDs for the traps into readable messages. For example, instead of the Object Identifier (OID) **1.3.6.1.4.1.32446.1.1.2** you would see **SNMPv2-SMI-v1::enterprises.32446.1.1.2 = 0** (example from the PRTG MIB).

You can use trap specific placeholders in notification templates in order to see the messages when you receive a notification. See the **More** <sup>1274</sup> section below for more information.

For a general introduction to the SNMP trap receiver's configuration, please see section **Monitoring Syslogs and SNMP Traps** <sup>1989</sup>.

For a general introduction to the technology behind SNMP, please see **Monitoring via SNMP** <sup>1995</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device **manually** <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be
-------------	------------------------------------------------------------------

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
148 SNMP Trap Receiver Sensor

Basic Sensor Settings	
	shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SNMP Trap Specific	
Listen on Port	Enter the port the sensor will listen on for SNMP traps. Usually port <b>162</b> is used. Please enter an integer value. We recommend using the default value.
Purge Messages After	Define how long received trap messages will be stored for analysis. Choose a period of time from the drop down list.

Filter	
Include Filter	Define if you want to filter traps. If you leave this field empty or use the keyword " <b>any</b> ", all data will be processed. To include specific types of traps only, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> .
Exclude Filter	Define which types of traps will be discarded and not processed. To exclude specific types of traps, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> .
Warning Filter	Define which types of traps will count for the <b>Warnings</b> channel. To categorize received traps as warning messages, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> .

Filter	
	<p><b>Note:</b> Messages are collected until a scanning interval ends; as long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a <b>Warning</b> status after a scanning interval has finished and there was at least one warning message (and no error message) during this interval. The status will remain <b>Warning</b> at least until the succeeding scanning interval has finished. If in this scanning interval no warning or error message occurred, the status of the sensor will turn <b>Up</b> again after the interval.</p>
Error Filter	<p>Define which types of traps will count for the <b>Errors</b> channel. To categorize received traps as error messages, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> <sup>1279</sup>.</p> <p><b>Note:</b> Messages are collected until a scanning interval ends; as long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a <b>Down</b> status after a scanning interval has finished and there was at least one error message during this interval. The status will remain <b>Down</b> at least until the succeeding scanning interval has finished. If in this scanning interval no warning or error message occurred, the status of the sensor will turn <b>Up</b> again after the interval.</p>

Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1700</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

**Debugging****Log Data to Disk**

Define if the probe will write a log file of the received data to the data folder (see [Data Storage](#)<sup>2074</sup>) to the disk for debugging purposes. Choose between:

- **Off (recommended):** Do not write additional log files. Recommended for normal use cases.
- **On:** Write log files for all data received.

**Note:** Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

**Filter Rules for Traps**

Filter rules are used for the include, exclude, warning, and error definition fields of the Trap Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which traps will be monitored; warning and error filters define how received traps will be categorized. Provide these filters in the sensor settings as formulas. Formulas are fields which can be combined with boolean operators (**AND**, **OR**, **NOT**) and brackets.

Field	Parameter	Examples
<b>source</b> [ip]	Enter an IP address where the UDPs come from; <a href="#">IP masks and ranges</a> <sup>2038</sup> are also possible.	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/255]
<b>agent</b> [ip]	Enter an IP address which specifies the object that creates the SNMP trap. Only v1 is supported.	agent[10.0.0.1]
<b>enterprise</b> [oid]	Enter an OID which specifies the object that originates the trap. Only v1 is supported.	enterprise [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0]
<b>bindings</b> [text]	Enter a substring to match all OIDs and values in the bindings.	bindings[ERROR], bindings [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0]
<b>bindings</b> [oid,value]	Enter an OID and a substring to match a value in the given OID. Separate OID and value with a comma.	bindings [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0,error]
<b>gentrap</b> [number]	Enter a number which specifies the generic trap type. Ranges are also possible.	gentrap[3], gentrap[2-6]

<b>spectrap</b> [number]	Enter a number which defines the specific trap code. Ranges are also possible.	spectrap[4], spectrap[0-3]
<b>version</b> [number]	Enter a number (1 or 2) which specifies the SNMP version.	version[1], version[2]
<b>community</b> [text]	Enter a community string for exact, case sensitive match.	community[public], community[private]

## Messages Tab: Review and Analyze Traps

Received traps are stored as common files in PRTG's data folder (see section [Data Storage](#)<sup>[2074]</sup>). In order to review and analyze all received messages, you can access the most recent data directly in PRTG's web interface via the respective sensors on the **Overview** tab in a [table list](#)<sup>[156]</sup>. **Note:** Received traps are only shown after an (automatic) page refresh following to a sensor scan in the table on the **Overview** tab (default for [auto refresh](#)<sup>[1812]</sup> is 30 seconds).

For more details and further filter options, click on the **Messages** tab of the SNMP Trap Receiver sensor. You will see all received messages in a [table list](#)<sup>[156]</sup>. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG will load the filtered list automatically.

### Advanced Filter Settings

You can open advanced filter settings with a click on the gear icon in the **Filter** row. The **Advanced Filter** will appear in a popup window. In the text field, you can define a filter using the syntax as given in section [Filter Rules for Traps](#)<sup>[1273]</sup>. If you have provided filter parameters on the **Messages** tab, these will be already included in the advanced filter as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.149 SNMP Windows Service Sensor

The SNMP Windows Service sensor monitors a Windows service via Simple Network Management Protocol (SNMP). It shows the operating status of the monitored service. Operating states can be **Active** (sensor status **Up**), or **Continue-Pending**, **Pause-Pending**, and **Paused** (all with sensor status **Down**).

**Note:** This sensor type cannot distinguish the status "not installed" from "not running".

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

For a general introduction to the technology behind SNMP, please see [Monitoring via SNMP](#)<sup>1955</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor services on Windows, PRTG will create one sensor for each service you select. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### SNMP Windows Service Monitor

Service	Select the services you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
---------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be
-------------	------------------------------------------------------------------

Basic Sensor Settings	
	shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SNMP Windows Service Monitor	
Service	Shows the service monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) <sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#) <sup>94</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#) <sup>142</sup> section.

## 6.8.150 SNTP Sensor

The SNTP Sensor monitors a Simple Network Time Protocol (SNTP) server. It returns the response time and the time difference in comparison to the local system time.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Timeout (Sec.)	Enter a timeout in seconds. If the reply takes longer than this value the request is aborted and an error message is triggered. The maximum timeout value is <b>900</b> seconds (equals 15 minutes).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>  . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.151 SSH Disk Free Sensor

The SSH Disk Free sensor monitors free space on disks of a Linux/Unix system using Secure Shell (SSH). It shows the total free disk space (sum), and the free disk space in percent for every mounted partition (volume).

**Note:** The free space returned by this sensor type shows the available disk space of the volume, minus a reserve defined for this volume (e.g. for redundancy purposes). So, this sensor shows the disk space that is actually **available** for use. The size of the reserved disk space can be defined with `tune2fs`. For details, please see the article linked in the [More](#) <sup>1293</sup> section below.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#) <sup>1962</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.

Basic Sensor Settings	
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <code>Result of Sensor [ID].txt</code>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

**Set limits checked against ALL disks**

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status; depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor's **Channels** settings. **Note:** All limits defined here are valid additionally to the limits defined in the particular **Channels** settings!

Percentage Limit Check	<p>Enable or disable a limit check for the free space in percentage channels of all drives. By default percentage limits are enabled with lower warning and lower error limit. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Percentage Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Percentage Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when free space limits are undercut or overrun.</li> </ul>
Upper Error Limit	<p>This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Down</b> status. If the free disk space of one of your drives overruns this percent value, the sensor will be set to <b>Down</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>1709</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Upper Warning Limit	<p>This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Warning</b> status. If the free disk space of one of your drives overruns this percent value, the sensor will be set to <b>Warning</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>1709</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Lower Warning Limit	<p>This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for a warning state. If the free disk space of one of your drives undercuts this percent value, the sensor will be set to warning. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>1709</sup>. The limits set here and in the channel settings are valid simultaneously!</p>

Set limits checked against ALL disks	
Lower Error Limit	This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for entering a <b>Down</b> status. If the free disk space of one of your drives undercuts this percent value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Byte Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Byte Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Byte Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when free space limits are undercut or overrun.</li> </ul>
Upper Error Limit	This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!

**Set limits checked against ALL disks**

Lower Error Limit	This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Deactivate alarm (default):</b> Select this option if you do not want an alarm for a removed disk.</li> <li>▪ <b>Activate Alarm:</b> Select this option if you want to be alerted if a monitored disk is removed.</li> </ul>

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

## Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.152 SSH INodes Free Sensor

The SSH INodes Free sensor monitors the free index nodes on disks of Linux/Unix and Mac OS systems via Secure Shell (SSH). It shows the free index nodes in percent, for each mount in an own sensor channel.

UNIX file systems only allow a limited number of index nodes. If the limit is exceeded, no more data can be stored, although there might be still free space available. This sensor can help you to notice early on if one of your drives is running out of INodes.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <code>Result of Sensor [ID].txt</code>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## 6.8.153 SSH Load Average Sensor

The SSH Load Average sensor monitors the load average of a Linux/Unix system using Secure Shell (SSH). It shows the average system load within a one, five, and 15 minutes interval (each in one channel).

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Part 6: Ajax Web Interface—Device and Sensor Setup | 8 Sensor Settings  
153 SSH Load Average Sensor

SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <code>Result of Sensor [ID].txt</code>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## 6.8.154 SSH Meminfo Sensor

The SSH Meminfo sensor monitors the memory usage of a Linux/Unix system using Secure Shell (SSH). It shows the available memory in total and in percent. **Note:** This sensor type is not compatible with Mac OS systems.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <code>Result of Sensor [ID].txt</code>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: How and Where Does PRTG Store its Data?

- <http://kb.paessler.com/en/topic/463>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.155 SSH Remote Ping Sensor

The SSH Remote Ping sensor remotely monitors the connectivity between a system running Linux/OS X and an other device, using Internet Control Message Protocol (ICMP) echo requests ("Ping") and Secure Shell (SSH). It can show packet loss, as well as minimum, maximum, and average response times; all measured from the remote device you connect to.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SSH Remote Ping Configuration	
Target	Enter the DNS name or IP address of the target device the Ping is sent to. The sensor will remotely connect to the parent device it is created on via SSH, then perform a Ping request from this remote device to the target device/server. Please enter a string.
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between <b>1</b> and <b>10000</b> . Please enter an integer value. We recommend using the default value.
Packet Count	Enter the number of packets that is sent with each scanning interval.
Custom Parameter	Optionally enter additional parameters that will be added at the end of the ping command. Please do not use parameters that change the output format of the result to make sure it can still be parsed. You cannot enter another command here. Please enter a string or leave the field empty.
SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <b>cat /proc/loadavg</b> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <b>Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</b> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> </ul>

SSH Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## 6.8.156 SSH SAN Logical Disk Sensor

The SSH SAN Logical Disk sensor monitors a logical disk on a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose. The sensor can show the health status of the disk.

**Note:** This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.

**Note:** Sometimes the devices which you monitor with this sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see section **More** below.

For this sensor type, corresponding credentials must be defined in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)<sup>272</sup> you want to use the sensor on.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>1962</sup> section.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>2039</sup>.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor volumes on an SAN device, PRTG will create one sensor for each volume you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### SSH SAN Logical Disk Settings

##### Volume

Select the volumes you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <b>Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</b> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	Define what will be done with the result of the sensor. Choose between:

SSH Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
SSH SAN Logical Disk Settings	
Volume	Shows the volume that this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the volume that this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <http://kb.paessler.com/en/topic/60145>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.157 SSH SAN Physical Disk Sensor

The SSH SAN Physical Disk sensor monitors a physical disk on a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose. The sensor can show the health status of the disk, the total number of I/O operations, as well as the amount of transferred data.

**Note:** This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.

**Note:** Sometimes the devices which you monitor with this sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see section **More** below.

For this sensor type, corresponding credentials must be defined in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)<sup>[272]</sup> you want to use the sensor on.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor disks on an SAN device, PRTG will create one sensor for each disk you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SSH SAN Physical Disk Settings	
Disk	Select the disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <b>Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</b> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	Define what will be done with the result of the sensor. Choose between:

SSH Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
SSH SAN Physical Disk Settings	
Disk	Shows the disk that this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Disk Name	Shows the label of disk that this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the disk that this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <http://kb.paessler.com/en/topic/60145>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.158 SSH SAN System Health Sensor

The SSH SAN System Health sensor monitors the system health of a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose. The sensor can show several metrics of the SAN, such as temperatures, voltages, the overall unit status, as well as capacitor charge. Which monitoring data this sensor type can show depends on the available measurement components on the SAN.

**Note:** This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.

**Note:** Sometimes the devices which you monitor with this sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see section **More** below.

For this sensor type, corresponding credentials must be defined in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the [settings of the device](#)<sup>[272]</sup> you want to use the sensor on.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the system health of an SAN device, PRTG will create one sensor for each metric you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### SSH SAN Specific

Metric	
	Select the metrics you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SSH SAN Specific	
Metric	Shows the metric this sensor monitors. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	Define which port this sensor will use for the SSH connection. Choose between:

SSH Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <a href="#">Result of Sensor [ID].txt</a>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <a href="#">Vertical Axis Scaling</a> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- <http://kb.paessler.com/en/topic/60145>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.159 SSH Script Sensor

The SSH Script sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file located on the target system. The sensor shows the execution time, and can show one value returned by the executable file or script (in one channel only). For details about the return value format please see the [Application Programming Interface \(API\) Definition](#)<sup>2031</sup>.

**Note:** For security reasons, the script file must be stored on the target system. Please make sure the script has executable rights.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>1962</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Script	Select a script file from the list. The drop down menu will list all script files available in the <code>/var/prtg/scripts</code> directory on the target Linux/Unix system. In order for the files to appear in this list, please store them into this directory. Please make sure the script has executable rights. In order for the sensor to show the expected values and sensor status, your files must use the right format for the returned values (in this case, <code>exitcode:value:message</code> to stdout). The exitcode will determine the sensor status. For detailed information on the expected return format and on how to build custom sensors, please see the API documentation ( <a href="#">Application Programming Interface (API) Definition</a> <sup>2031</sup> ). There, find detailed information the the "Custom Sensors" tab. For an example script, please see <a href="#">More</a> <sup>1348</sup> section below.
Value Type	<p>Define what kind of values your script file gives back. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Integer:</b> An integer is expected as return value. If the script gives back a float, PRTG will display the value <b>0</b>.</li> <li>▪ <b>Float:</b> A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they don't produce a buffer overflow.</li> <li>▪ <b>Counter:</b> Your script returns an integer which increases. PRTG will show the difference between the values of two sensor scans. <b>Note:</b> A counter <b>must</b> return an integer; float is not supported here!</li> </ul>

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Script	Shows the script that is executed with each sensor scan, as defined on sensor creation. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Parameters	If your script file catches command line parameters, you can define them here. Placeholders can be used as well. For a full list of all placeholders please see the API documentation ( <a href="#">Application Programming Interface (API) Definition</a> <sup>[2031]</sup> ). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks ' ' with PowerShell scripts, and double quotes " " with all others. Please enter a string or leave the field empty.
Mutex Name	Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the <a href="#">More</a> <sup>[438]</sup> section below. Please enter a string or leave the field empty.
Value Type	Shows the expected value type, chosen on sensor creation. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew. <b>Note:</b> The sensor cannot handle string values.
If Value Changes	Define what shall be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> </ul>

Sensor Settings	
	<ul style="list-style-type: none"> <li>• <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716</sup> whenever the sensor value changes.</li> </ul>
SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <b>Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</b> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>2074</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) 1709 section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.160 SSH Script Advanced Sensor

The SSH Script Advanced sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file located on the target system. The sensor can show values returned by the script in multiple channels. The return value of this sensor must be valid XML. For details about the return value format please see the [Application Programming Interface \(API\) Definition](#)<sup>2031</sup>.

**Note:** For security reasons, the script file must be stored on the target system. Please make sure the script has executable rights.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>1962</sup> section.

### Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Script	Select a script file from the list. The drop down menu will list all script files available in the <code>/var/prtg/scripts.xml</code> directory on the target Linux/Unix system. In order for the files to appear in this list, please store them into this directory. Please make sure the script has executable rights. In order for the sensor to show the expected values and sensor status, your files must return the expected XML format to standard output. Values and message must be embedded in the XML. For detailed information on the expected return format and on how to build custom sensors, please see the API documentation ( <a href="#">Application Programming Interface (API) Definition</a> <sup>2031</sup> ). There, find detailed information the the "Custom Sensors" tab.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Script	Shows the script that is executed with each sensor scan, as defined on sensor creation. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Settings	
Parameters	<p>If your script file catches command line parameters, you can define them here. Placeholders can be used as well. For a full list of all placeholders please see the API documentation (<a href="#">Application Programming Interface (API) Definition</a><sup>[2031]</sup>). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks <code>' '</code> with PowerShell scripts, and double quotes <code>" "</code> with all others. Please enter a string or leave the field empty.</p>
Mutex Name	<p>Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the <a href="#">More</a><sup>[438]</sup> section below. Please enter a string or leave the field empty.</p>
EXE Result	<p>Define what will be done with the results the executable file gives back. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Discard EXE result:</b> Do not store the requested web page.</li> <li>• <b>Write EXE result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the script to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>
SSH Specific	
Connection Timeout (Sec.)	<p>Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.</p>
Shell Timeout (Sec.)	<p>Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code>).</p>
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>

SSH Specific	
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## 6.8.161 SSH VMWare ESX(i) Disk Sensor

The SSH VMWare ESX(i) Disk sensor monitors free space on disks of a VMware ESX(i) system using Secure Shell (SSH). It shows the free disk space for different mounts and total, in total and percent values.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** Not all Linux/Unix and Mac OS distributions can be supported by this sensor type.

For a general introduction to SSH monitoring, please see [Monitoring via SSH](#)<sup>[1962]</sup> section.

### Requirement: Root Credentials

In the parent device's **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems** settings, please use the **root** user of your VMware host for authentication! See [More](#)<sup>[1363]</sup> section below.

Please make sure you enable SSH on your VMware system!

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

Basic Sensor Settings	
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
SSH Specific	
Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. <code>cat /proc/loadavg</code> ).
SSH Port	<p>Define which port this sensor will use for the SSH connection. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherit port number from parent device (default):</b> Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems</a> section of the device this sensor is created on.</li> <li>▪ <b>Enter custom port number:</b> Do not use the port number from the parent device's settings, but define a different port number below.</li> </ul>
Use Port Number	This field is only visible if the custom port number setting is enabled above. Enter the port number this sensor will use for the SSH connection. Please enter an integer value.
Result Handling	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <code>Result of Sensor [ID].txt</code>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

### Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

### Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.162 Syslog Receiver Sensor

The Syslog Receiver sensor receives and analyzes syslog messages. It shows the overall number of received syslog messages per second, warning and error messages per second, as well as the number of dropped packets per second.

With the available filter options, you can define individually which types of messages will be considered for monitoring and thus stored, and which messages will be recognized as warning or error messages. Depending on the filters, received messages will be counted in the respective channels. The messages are stored in an internal database for later analysis. The received data will be available on your respective probe system as common files, as well as via the web interface.

You can add the sensor to the probe device on the one hand; then the sensor will receive all messages of the system running the probe. Alternatively, you can add the sensor to a specific device to gain all messages from this device directly; this will make this sensor type faster than just using source filters.

**Note:** This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

You can use syslog specific placeholders in notification templates in order to see the messages when you receive a notification. See the [More](#)<sup>1372</sup> section below for more information.

For a general introduction to the syslog receiver's configuration, please see section [Monitoring Syslogs and SNMP Traps](#)<sup>1390</sup>.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
-------------	-------------------------------------------------------------------------------------------------------------------------

**Basic Sensor Settings**

Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Syslog Specific**

Listen on Port	Enter the port the sensor will listen on for Syslog messages. Usually port <b>514</b> is used. Please enter an integer value. We recommend using the default value.
Purge Messages After	Define how long received syslog messages will be stored for analysis. Choose a period of time from the drop down list.

**Filter**

Include Filter	Define if you want to filter syslog messages. If you leave this field empty or use the keyword " <b>any</b> ", all data will be processed. To include specific types of messages only, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> .
Exclude Filter	Define which types of syslog messages will be discarded and not processed. To exclude specific types of messages, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> .
Warning Filter	Define which types of syslog messages will count for the <b>Warnings</b> channel. To categorize received messages as warning messages, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> .

Filter	
	<p><b>Note:</b> Messages are collected until a scanning interval ends; as long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a <b>Warning</b> status after a scanning interval has finished and there was at least one warning message (and no error message) during this interval. The status will remain <b>Warning</b> at least until the succeeding scanning interval has finished. If in this scanning interval no warning or error message occurred, the status of the sensor will turn <b>Up</b> again after the interval.</p>
Error Filter	<p>Define which types of syslog messages will count for the <b>Errors</b> channel. To categorize received messages as error messages, define filters using a special syntax. For more information, see section <a href="#">Filter Rules</a> <sup>1370</sup>.</p> <p><b>Note:</b> Messages are collected until a scanning interval ends; as long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a <b>Down</b> status after a scanning interval has finished and there was at least one error message during this interval. The status will remain <b>Down</b> at least until the succeeding scanning interval has finished. If in this scanning interval no warning or error message occurred, the status of the sensor will turn <b>Up</b> again after the interval.</p>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

### Debugging

#### Log Data to Disk

Define if the probe will write a log file of the received data to the data folder (see [Data Storage](#)<sup>2074</sup>) to the disk for debugging purposes. Choose between:

- **Off (recommended):** Do not write additional log files. Recommended for normal use cases.
- **On:** Write log files for all data received.

**Note:** Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

### Filter Rules for Syslog Messages

Filter rules are used for the include, exclude, warning, and error definition fields of the Syslog Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which messages will be monitored; warning and error filters define how received messages will be categorized. Provide these filters in the sensor settings as formulas. Formulas are fields which can be combined with boolean operators (**AND**, **OR**, **NOT**) and brackets.

Field	Parameter	Example
<b>source</b> [ip]	the IP address where the messages will be received from; masks and ranges are also possible	<ul style="list-style-type: none"> <li>▪ source[10.0.23.50]</li> <li>▪ source[10.0.23.10-50]</li> <li>▪ source[10.0.23.10/255]</li> </ul>
<b>facility</b> [number]	any number (or range) from 0 to 23 specifying the type of program sending the message	<ul style="list-style-type: none"> <li>▪ facility[2]</li> <li>▪ facility[5-7]</li> <li>▪ facility[5] OR facility[6]</li> </ul>
<b>severity</b> [number]	any number (or range) from 0 (emergency) to 7 (debug) specifying the type of message	<ul style="list-style-type: none"> <li>▪ severity[4]</li> <li>▪ severity[1-3]</li> <li>▪ severity[1] AND severity [2]</li> </ul>
<b>host name</b> [text]	any string specifying the hostname of a device in the message	<ul style="list-style-type: none"> <li>▪ hostname [www.example.com]</li> </ul>

<b>tag</b> [text]	any string specifying the tag of a program or process in the message	▪ tag[su]
<b>appname</b> [text]	any string specifying the appname part of the message	▪ appname[myproc] ▪ appname[demo] AND msgid[m42]
<b>procid</b> [text]	any string specifying the process identifier part of the message	▪ procid[1 860]
<b>msgid</b> [text]	any string specifying the message identifier part of the message	▪ msgid[ID47]
<b>message</b> [parttext]	any string specifying the message part of the message (substring will match; <b>case insensitive</b> !)	▪ message[Error]
<b>data</b> [id, param, value]	checks the SD-ID block of the message's structured data for a parameter matching the given value	▪ data [exampleSDID@1 2345,eventSource,Application]
<b>data</b> [parttext]	checks if the given substring matches on structured data as displayed in the corresponding table	▪ data [exampleSDID@1 234]
<b>data</b> [id, param]	checks if the parameter exists in the given ID element	▪ data [exampleSDID@1 234,eventSource]

**Note:** String parameters (except the substring in **message**) have to match **exactly** the particular parts of the message; they are case sensitive!

## Messages Tab: Review and Analyze Syslog Messages

Received syslog messages are stored as common files in PRTG's data folder (see section [Data Storage](#)<sup>[2074]</sup>). In order to review and analyze all received messages, you can access the most recent data directly in PRTG's web interface via the **Overview** tab of the respective sensor in a [table list](#)<sup>[156]</sup>. **Note:** Received syslogs are only shown after an (automatic) page refresh following to a sensor scan in the table on the **Overview** tab (default for [auto refresh](#)<sup>[1812]</sup> is 30 seconds).

For more details and further filter options, click on the **Messages** tab of the Syslog Receiver sensor. You will see all received messages in a [table list](#)<sup>[156]</sup>. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG will load the filtered list automatically.

## Advanced Filter Settings

You can open advanced filter settings with a click on the gear icon in the **Filter** row. The **Advanced Filter** will appear in a popup window. In the text field, you can define a filter using the syntax as given in section [Filter Rules for Syslog Messages](#)<sup>1370</sup>. If you have provided filter parameters on the **Messages** tab, these will be already included in the advanced filter as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.163 System Health Sensor

The System Health sensor monitors internal PRTG parameters. It shows the status of the system. This sensor type is created automatically by PRTG and cannot be deleted. It checks various parameters of your PRTG system which can affect the quality of the monitoring results:

- **Health:** This index value sums up the probe state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **Available Memory:** This channel shows the amount of free memory available on the system. This value should not fall below 500 MB. This way PRTG still can request resources during report generation, auto-discoveries, and other issues.
- **Available Memory Percent:** This channel shows the free memory available on the system in percent.
- **CPU Load:** This channel shows the current percentage CPU load. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.

This sensor can be set up on a Probe Device only!

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.164 TFTP Sensor

The TFTP sensor monitors a Trivial File Transfer Protocol (TFTP) server and checks if a certain file is available for download. It shows the availability.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Specific	
Timeout (sec)	Enter a timeout in seconds for the TFTP connect. If the reply takes longer than this value the request is aborted and an error message is triggered. Please enter an integer value.
Port	Enter the number of the port the TFTP service is running on. The sensor will try to connect to it. Please enter an integer value.

Sensor Specific	
Filename	Enter the name of the file the sensor will check. If this filename is not available on the server, the sensor's state will be set to down. Please enter a string.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.165 Traceroute Hop Count Sensor

The Traceroute Hop Count sensor traces the number of hops needed from the probe system the sensor is running on to the **IP Address/DNS Name** defined in the sensor's parent device. It returns the number of hops. In case this number changes, you can additionally change the sensor's status.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

If Route Changes	<p>Define what will be done in case the route has changed since the last check. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore:</b> Do not perform any action.</li> <li>▪ <b>Set sensor to "Warning":</b> Set the sensor to warning status.</li> <li>▪ <b>Set sensor to "Error":</b> Set the sensor to error status.</li> </ul>
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.166 Virtuozzo Container Disk Sensor

The Virtuozzo Container Disk sensor monitors a container disk on a Parallels™ Virtuozzo host server. This sensor must be created on a Windows server parent device running Virtuozzo. For each container, it can show free disk space in percent, used disk space (kb-blocks), allowed quota (kb-blocks), and hard limit (kb-blocks).

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Container Settings	
Container	Select all containers for which you want to create a sensor for disk monitoring. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Container Settings

Env ID	Shows the unique ID of the container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the monitored container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
OS	Shows the operating system running on the container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows a description for the container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Powered Off Containers	<p>Define if the sensor will go into an error state if the container is powered off.</p> <ul style="list-style-type: none"> <li>• <b>Alarm when powered off:</b> Set the sensor for a container to error if the container is powered off.</li> <li>• <b>Ignore powered off state:</b> Only show zero values for a sensor when the monitored container is powered off. Do not set the sensor to error.</li> </ul>

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor.

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.167 Virtuozzo Container Network Sensor

The Virtuozzo Container Network sensor monitors the network traffic of a container on a Parallels™ Virtuozzo host server. This sensor must be created on a Windows server parent device running Virtuozzo. For each container, it can show network usage as incoming and outgoing bytes as well as its sum, and the number of incoming and outgoing packets.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Container Settings	
Container	Select all containers for which you want to create a sensor. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Container Settings**

Env ID	Shows the unique ID of the container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the monitored container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
OS	Shows the operating system running on the container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows a description for the container. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Powered Off Containers	<p>Define if the sensor will go into an error state if the container is powered off.</p> <ul style="list-style-type: none"> <li>• <b>Alarm when powered off:</b> Set the sensor for a container to error if the container is powered off.</li> <li>• <b>Ignore powered off state:</b> Only show zero values for a sensor when the monitored container is powered off. Do not set the sensor to error.</li> </ul>

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor.

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Scanning Interval	
Interval	The scanning interval of this sensor type cannot be inherited or changed. Due to internal restrictions of the VirtuoZZo system, a fix value must be used.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.168 VMware Host Hardware (WBEM) Sensor

The VMware Host Hardware sensor monitors hardware information of a ESX/ESXi server using Web-Based Enterprise Management (WBEM). It shows the current reading and health state.

**Note:** The parent device must be a VMware ESX/ESXi server version 3.5, 4.0, 5.0, 5.1, or 5.5. For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one elements multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

ESX Server Elements	
ESX Element	Select the hardware elements you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
ESX Server Elements	
Element	Shows the ESX element monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Automatic Sensor State	<p>Define if the sensor will change its status dependent on the health state reading. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Set sensor state automatically to 'Warning' or 'Down':</b> Set the sensor to a <b>Warning</b> or <b>Down</b> status when the server returns respective values. The sensor will additionally change to a <b>Down</b> status if the connection to the server fails.</li> <li>▪ <b>Just report the current reading, ignore Server Health Value:</b> Never change the sensor's status dependent on the values returned by the server. The sensor will only change to a <b>Down</b> status if the connection to the server fails.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.169 VMware Host Hardware Status (SOAP) Sensor

The VMware Host Hardware Status (SOAP) sensor monitors the hardware status of a VMware host server using Simple Object Access Protocol (SOAP). It shows the total number of items in "Normal", "Warning," and "Alert" states, just as shown in the vSphere client. This sensor is intended to give you a general status overview for your host. Any states other than "Normal" will be reported in the sensor message. **Note:** This sensor only shows items that report an actual state; therefore you might see more "sensors" in your vSphere client than the number of states available in the channels of this PRTG sensor.

**Note:** The parent device must be a VMware ESX/ESXi server version 3.5, 4.0, 5.0, 5.1, or 5.5. We recommend to **not** use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.

For this sensor type credentials for VMware servers must be defined for the device you want to use the sensor on. Please make sure you enter a user with sufficient access rights to obtain statistics (read-only should work).

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)<sup>[2050]</sup> or when running a [cluster](#)<sup>[81]</sup> setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VMware Host Settings	
Host Server	Select the host server you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

VMware Host Settings	
MoID	The Managed Object ID (MoID) of the host. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>
Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

- <http://kb.paessler.com/en/topic/30643>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.170 VMware Host Performance (SOAP) Sensor

The VMware Host Performance (SOAP) sensor monitors a VMware host server using Simple Object Access Protocol (SOAP). It shows CPU (percent) and memory (absolute) usage, disk read and write speed, and network received and transmitted speed of a VMware host server.

**Note:** The parent device must be a VMware ESX/ESXi server version 3.5, 4.0, 5.0, 5.1, or 5.5.

For this sensor type credentials for VMware servers must be defined for the device you want to use the sensor on. Please make sure you enter a user with sufficient access rights to obtain statics (read-only should work).

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)<sup>[2050]</sup> or when running a [cluster](#)<sup>[81]</sup> setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

**More**

Knowledge Base: How can I increase the connection limit on VMware systems?

- <http://kb.paessler.com/en/topic/30643>

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

**Notifications**

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.171 VMware Virtual Machine (SOAP) Sensor

The VMware Virtual Machine (SOAP) sensor monitors a virtual machine on a VMware host server using Simple Object Access Protocol (SOAP). It shows CPU (percent) and memory (absolute) usage, disk read and write speed, read and write latency, and network usage (total, received, and transmitted) of a single virtual machine.

**Note:** The parent device must be a VMware ESX/ESXi server version 3.5, 4.0, 5.0, 5.1, or 5.5; or a respective Virtual Center server. We recommend using Virtual Center as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using vMotion.

For this sensor type credentials for VMware servers must be defined for the device you want to use the sensor on. Please make sure you enter a user with sufficient access rights to obtain statics (read-only should work).

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#)<sup>[2050]</sup> or when running a [cluster](#)<sup>[87]</sup> setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

**Note:** PRTG requests a full list of all virtual machines configured on the device. Therefore, it may take a few seconds before the dialog is loaded.

If you select more than one virtual machine, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Virtual Machine Settings	
Virtual Machine	You see a list of all virtual machines (VMs) available on the host server on this device, including the ones that are not running. All VMs are listed with name and the OS it is running on. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Virtual Machine Settings**

MoID	Shows the Managed Object ID (MoID) of the virtual machine. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Handling of "Powered off" VM	<p>Choose how the sensor will react to a virtual machine that is powered off. Please choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore "powered off" state (default):</b> The sensor will not change to a <b>Down</b> status if the virtual machine is powered off; it will report zero values instead.</li> <li>• <b>Alarm when VM is "powered off":</b> The sensor will change to a <b>Down</b> status if the virtual machine is powered off. Note: While in Down status, a sensor does not record any data in all of its channels.</li> </ul>

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>94</sup>.

## More

- <http://kb.paessler.com/en/topic/30643>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.172 WBEM Custom Sensor

The WBEM Custom Sensor performs a custom query via Web-Based Enterprise Management (WBEM). It can show the total and channels received.

For this sensor type credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems must be defined for the device you want to use the sensor on.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

#### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

#### Custom Query Specific

Namespace	Enter the namespace for the query. Default value is <b>root/cimv2</b> .
WBEM Query (WQL)	Enter the WBEM Query that will be performed with every scanning interval. It has to be written in CQL/WQL.

**Custom Query Specific****Numeric Format**

Define the expected type of the returned values. Choose between:

- **Integer:** The query returns integer values.
- **Float:** The query returns float values.

**Sensor Display****Primary Channel**

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. **Note:** You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

**Chart Type**

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. **Note:** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)<sup>1709</sup> settings).

**Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## More

For more tips and tricks regarding WQL scripts, please see the Paessler Knowledge Base and search for **WQL**.

- <http://www.paessler.com/knowledgebase>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.173 Windows CPU Load Sensor

The Windows CPU Load sensor monitors the CPU load on a computer via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows the CPU usage in percent.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

#### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

#### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
WMI Alternative Query	
Errors and invalid data	This is an extended help field only. PRTG's WMI sensors are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do that in the future) some WMI classes over the various Windows/ServicePack/patchlevel versions, resulting in errors like "class not valid" or "invalid data". Wherever possible PRTG features an alternative query that might work in your specific circumstances. When you keep getting errors for this sensor please try enabling the alternative query method below.
Alternative query	Choose the method PRTG uses to query via WMI. For compatibility reasons, an alternative query method can be enabled. We recommend using the default value. You can choose between:

WMI Alternative Query	
	<ul style="list-style-type: none"> <li>• <b>use default</b>: Use PRTG's standard method to query WMI. This is the best setting in most cases.</li> <li>• <b>use alternative</b>: Use an alternative method to query WMI. If you keep getting errors, please try this setting.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note</b> : You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default)</b>: Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other</b>: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note</b>: This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[1861]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.174 Windows IIS 6.0 SMTP Received Sensor

The Windows IIS 6.0 SMTP Receiver Sensor monitors Microsoft's Internet Information Services regarding the number of received emails for an IIS 6.0 SMTP service (Exchange 2003) using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows the number of messages, the bytes, and the number of retries, per second for received messages.

**Note:** This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

#### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

#### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.175 Windows IIS 6.0 SMTP Sent Sensor

The Windows IIS 6.0 SMTP Sent Sensor monitors Microsoft's Internet Information Services regarding the number of sent emails for an IIS 6.0 SMTP service (Exchange 2003) using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows the number of messages, the bytes, and the number of retries, per second for sent messages.

**Note:** This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

#### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

#### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

### 6.8.176 Windows IIS Application Sensor

The Windows IIS Application sensor monitors a Microsoft Internet Information Services server using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS). The sensor shows bytes sent and received as well as post, get, and CGI requests, not found errors, anonymous and known users, and received and sent files, in number/second.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[209]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[199]</sup> section.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

#### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[209]</sup>. **Note:** The target system may well run on Windows 2003 or later.

#### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one web service instance, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI Internet Information Services	
Specify Instance	You see a list of all web service instances running on this device. There is also a "_Total" instance available. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### WMI Internet Information Services

Instance	The name of the web services instance that is monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.177 Windows Last Update Sensor

The Windows Last Update sensor reads the number of days since last Windows update from its parent device and returns the number of days. Use [threshold triggers](#)<sup>[1716]</sup> to get notified in case this number breaches a certain value.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

#### Requirement: Enable Remote Registry Service

In order for this sensor to work, you need to enable the **RemoteRegistry** "Remote Registry" Windows service on the target machine. To do so, please log in to this machine and open the services manager (e.g. start **services.msc**). In the list of services, find the **Remote Registry** service and set its **Start Type** to **Automatic**.

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Timeout (sec.)	Define the timeout for the internal process. It will be killed if it has not returned a result after this time. Please enter an integer value.
If Value Changes	<p>Define what will be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>[1716]</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Knowledge Base: Fixing a Protocol Error Appearing With Windows Last Update Sensor

- <http://kb.paessler.com/en/topic/41113>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.178 Windows Logged In Users Sensor

The Windows Logged In Users sensor queries the number of users logged in to a Windows installation on the parent device. It returns the total number. You can optionally filter for certain user names.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

#### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

#### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89)</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
User Filter (optional)	To filter the value returned by certain user names, define them here. Enter a comma separated list of user names, or leave the field empty.
Processing of Users in "User Filter"	<p>Define how the user names entered above will be used. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not count users listed in "User Filter":</b> Exclude the users entered above from counting and only count other uses.</li> <li>▪ <b>Only count users listed in "User Filter":</b> Ignore all other users and only count user names from the list entered above.</li> </ul>
If Value Changes	<p>Define what will be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>▪ <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716)</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>
Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.179 Windows MSMQ Queue Length Sensor

The Windows MSMQ Queue Length sensor reads the number of messages in a Microsoft Message Queue of the parent device. It gives back the total number.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

#### Requirement: Message Queuing Service

In order for this sensor to work, the **MSMQ** "Message Queuing" service must be started both on the target system and on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. Additionally, the MSMQ "Message Queuing" service must also be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

Depending on your Windows version you may first need to install the **Microsoft Message Queue (MSMQ) Server**.

**Note:** When installing Microsoft Message Queue (MSMQ) Server, make sure you install it including the **Directory Service**. Depending on your Windows installation this might have different names, such as

- MSMQ Active Directory Domain Service Integration
- Directory Service Integration
- Active Directory Integration

For details, please see [More](#)<sup>1474</sup> section below.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Message Queue	You see a list showing the names of all message queues found on the target device. If there are no message queues available, you will see a corresponding message. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> Sub-queues are not supported by this sensor.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

Basic Sensor Settings	
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>189</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Message Queue	Shows the name of the task monitored by this sensor. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:
Min. Message Age	Optionally define an age in minutes the message has to be old. If set, messages younger than this will not be regarded. If you leave this field blank, the sensor will not check for the message age. Please enter an integer value or leave the field empty.
If Value Changes	<p>Define what will be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Knowledge Base: How do I activate Message Queuing in my Windows installation?

- <http://kb.paessler.com/en/topic/25963>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.180 Windows Network Card Sensor

The Windows Network Card sensor monitors bandwidth usage and traffic of a network interface using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For devices with multiple network cards multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Network Interface	Select the network card(s) you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Selected Interface	Shows the name of the network card that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
<b>Sensor Display</b>	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> <li>▪ <b>Show in and out traffic as positive and negative area chart:</b> Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.181 Windows Pagefile Sensor

The Windows Pagefile sensor monitors the Windows pagefile usage via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows the usage in percent. **Note:** This sensor does **not** work with Windows 2000, because the respective WMI class does not exist on this operating system!

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[206]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[199]</sup> section.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[206]</sup>. **Note:** The target system may well run on Windows 2003 or later.

### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.182 Windows Physical Disk Sensor

The Windows Physical Disk sensor monitors parameters of a physical disk of a Windows device using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It shows accumulated disk read/write time and bytes, queue, split IO, etc. on physical disks.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Windows Physical Disk Specific	
Physical Disks	<p>You see a list showing the <b>Name</b> of the counters you can monitor as well as the <b>Instance</b>, i.e. the respective logical disk (or '_Total'). If there are no logical disks available, you will see a corresponding message. From the list, choose all <b>Name/Instance</b> combinations you want to monitor by adding a check mark in front of the respective line (for example, choose '% Disk Read Time for C:').</p> <p>A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.</p>

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Readings Accessible Using WMI**

Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	

Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (System)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2014</sup> section.</li> </ul>
---------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor.

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

### Schedules, Dependencies, and Maintenance Window

#### Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

### Access Rights

#### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.183 Windows Print Queue Sensor

The Windows Print Queue sensor reads the print queue on its parent device and gives back the number of jobs in the print queue. It can monitor queues for all printers that are installed locally. For example, you can use this sensor to monitor all print queues on your Windows print server. Additionally, this sensor can change to a **Warning** status if there is a printer problem, such as out of paper, etc.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

#### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

#### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

#### Requirement: Print Spooler Service

In order for this sensor to work, the **Spooler** "Print Spooler" service must be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Print Queue	You see a list showing the names of all print queues found on the target device. If there are no print queues available, you will see a corresponding message. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> If a printer name changes after you created a sensor for its queue, please add the sensor anew.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Print Queue Name	Shows the name of the task monitored by this sensor. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:
Min. Print Job Age (sec.)	Optionally define the age in seconds. If set, jobs younger than this will not be regarded. If you leave this field blank, the sensor will not check for the print job age. Please enter an integer value or leave the field empty.
Set to Warning on Problem Reported	<p>Define if the sensor will change to a <b>Warning</b> status in case a printer reports a problem. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No</b></li> <li>▪ <b>Yes</b></li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

**Schedules, Dependencies, and Maintenance Window****Dependency Type**

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device it is created on is in a **Down** status, or if it is paused by another dependency.
- **Select object:** Pause the current sensor if the device it is created on is in an **Down** status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

**Note:** Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.

**Dependency**

This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the [object selector](#)<sup>[159]</sup> to choose an object on which the current sensor will be dependent on.

**Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>1421</sup> section.

## 6.8.184 Windows Registry Sensor

The Windows Registry sensor reads a string value from the Windows registry and can process the result using a keyword search. The value is shown in the sensor's last message field. **Note:** Only **REG\_SZ** values can be processed with this sensor.

### Requirement: Remote Registry Service

In order for this sensor to work, please make sure the **RemoteRegistry** "Remote Registry" Windows service is running on both the computer running the PRTG probe and the target machine.

To enable the service, please log in to the respective computer and open the services manager (e.g. via **services.msc**). In the list, find the respective service and set its **Start Type** to **Automatic**.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

Please make sure that the Windows user account running the **PRTGProbeService** "PRTG Probe Service" on the computer running the PRTG probe has access to the registry of the remote computer (by default, this is the probe computer's local Windows "system" account).

Additionally, the computer running the PRTG probe and the target computer must be member of the same Windows local domain.

**Note:** You cannot perform a remote registry call with a Windows user account for which no password is defined.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Registry Settings	
Root	<p>Select the root key of the registry entry you want to monitor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>HKEY_CLASSES_ROOT</b></li> <li>▪ <b>HKEY_CURRENT_USER</b></li> <li>▪ <b>HKEY_LOCAL_MACHINE</b></li> <li>▪ <b>HKEY_USERS</b></li> <li>▪ <b>HKEY_PERFORMANCE_DATA</b></li> <li>▪ <b>HKEY_CURRENT_CONFIG</b></li> <li>▪ <b>HKEY_DYN_DATA</b></li> </ul>
Key Name	Enter the path of the key you want to monitor. Enter the full path after the root, each subkey divided by a backslash. For example, enter <b>Software\Microsoft\Windows\CurrentVersion</b>
Value Name	Enter the name of the value you want to monitor. For example, enter <b>ProductId</b> to read the product ID of the target computer's Windows installation.
64-Bit Selection	<p>Define how the provided key name will be looked up. This is relevant for some registry keys only, for example those containing the <b>Wow6432Node</b> subkey. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use 32-bit registry view:</b> The key provided above is copied from the 32-bit registry editor.</li> </ul>

Registry Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Use 64-bit registry view:</b> The key provided above is copied from the 64-bit registry editor.</li> </ul> <p>For more information, see the <a href="#">More</a> <sup>1508</sup> section below.</p>
Value	<p>Select if the returned result will be further processed. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore Value:</b> Do not perform any more keyword checks. The registry value is shown in the sensor last message field only.</li> <li>▪ <b>Process Text:</b> Use the returned value to perform keyword checks. Select below.</li> </ul>
Check For Existing Keywords (Positive)	<p>This setting is only visible if text processing is activated above. Check if a certain keyword is part of the received value. If there is no match, the sensor will show a "Down" status.</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not check for positive keywords.</li> <li>▪ <b>Enable keyword check (positive):</b> Check if a certain keyword exists in the received value. Define below.</li> </ul>
Text Must Include	<p>This setting is only visible if keyword check is activated above. Enter a search string that must be contained in the returned value.</p>
For Keyword Search Use	<p>Define the method you want to provide the search string with. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for a simple string.</li> <li>▪ <b>Regular Expression:</b> Search using a regular expression. For more details, see <a href="#">Regular Expressions</a> <sup>2048</sup> section.</li> </ul>
Check For Existing Keywords (Negative)	<p>This setting is only visible if text processing is activated above. Check if a certain keyword is <b>not</b> part of the received value. If there <b>is</b> a match, the sensor will show a "Down" status.</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not check for negative keywords.</li> <li>▪ <b>Enable keyword check (negative):</b> Check if a certain keyword does not exist in the received value. Define below.</li> </ul>
Text Must Not Include	<p>This setting is only visible if keyword check is activated above. Enter a search string that must not be contained in the returned value.</p>
For Keyword Search Use	<p>Define the method you want to provide the search string with. Choose between:</p>

Check For Existing Keywords (Positive)	<p>This setting is only visible if text processing is activated above. Check if a certain keyword is part of the received value. If there is no match, the sensor will show a "Down" status.</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not check for positive keywords.</li> <li>▪ <b>Enable keyword check (positive):</b> Check if a certain keyword exists in the received value. Define below.</li> </ul>
	<ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for a simple string.</li> <li>▪ <b>Regular Expression:</b> Search using a regular expression. For more details, see <a href="#">Regular Expressions</a><sup>2048</sup> section.</li> </ul>

### Sensor Display

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

### Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## More

How do I discern 32-bit registry values vs. 64-bit registry values?

- <http://kb.paessler.com/en/topic/25513>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.185 Windows Scheduled Task Sensor

The Windows Scheduled Task sensor returns the number of minutes since the last run of the specified task as well as the corresponding exit code. If a task was never run, the sensor shows an error. You can define limits (in minutes) in the [channel settings](#)<sup>[1709]</sup> for **Last Run** in order to set the sensor into a warning or error status if the last run of the task was too long ago.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Requirement: Remote Registry Service

In order for this sensor to work, please make sure the **RemoteRegistry** "Remote Registry" Windows service is running on both the computer running the PRTG probe and the target machine.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

## Requirement: Monitored Systems

**Note:** We recommend running the PRTG probe on Windows 2008 R2 or later.

Microsoft implemented two versions of scheduled task, V1 and V2. Windows 2000, Windows XP, and Windows Server 2003 create scheduled tasks V1 by default. Later Windows versions can create and read both versions.

- If the system running the PRTG probe (either on the core server or a remote probe) runs on one of these early Windows versions, you will not be able to monitor scheduled tasks of V2. In this case, please create the tasks on the monitored machines compatible with "Windows Server 2003, Windows XP, or Windows 2000" if there is a newer Windows version installed.

**Note:** These Windows versions are not officially supported by PRTG; see section [System Requirements](#) <sup>[21]</sup>.

- If the system running the PRTG probe (either on the core server or a remote probe) runs on Windows Vista or later, you will be able to monitor scheduled tasks of both V1 and V2 (i.e. from all Windows versions).

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#) <sup>[22]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor scheduled tasks, PRTG will create one sensor for each task you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Sensor Settings	
Task Name	You see a list showing the names of all tasks found in the Windows Task Scheduler on the target device. If there are no scheduled tasks, you will see a corresponding message. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> If a task name changes after you created a sensor for it, please add the sensor anew.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>89</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
Ignore Status Codes	Define exit codes of the monitored task which will not be processed by the sensor. If the external program returns one of these values, they will be converted into the code 0. Enter a comma separated list of exit codes or leave this field empty.
Name	Shows the name of the task monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	<p>Define what will be done if the value which the external program returns changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>1716</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.186 Windows System Uptime Sensor

The Windows System Uptime sensor monitors uptime of a Windows system using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It returns the total uptime.

**Note:** By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback in case Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. The default behavior can be changed in the **Windows Compatibility Options** of the parent [device's settings](#)<sup>[280]</sup> this sensor is created on.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

### Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a [remote probe](#)<sup>[2050]</sup>. **Note:** The target system may well run on Windows 2003 or later.

### Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the **Remote Registry** Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (e.g. via [services.msc](#)). In the list, find the respective service and set its **Start Type** to **Automatic**.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.187 Windows Updates Status (Powershell) Sensor

The Windows Updates Status (Powershell) sensor monitors the status of Windows updates on a computer and counts the available and installed Windows updates—either from Microsoft or from the local Windows Server Update Services (WSUS) server. This sensor can show the time elapsed since the last update, as well as the following numbers:

- Installed Windows updates
- Missing Windows updates
- Installed security updates with low, moderate, important, and critical priority
- Missing security updates with low, moderate, important, and critical priority

You can find the considered updates in **Server Manager (WSUS)** under **Roles | Windows Server Update Services | Update Services | Computers | Reports**.

**Note:** If the sensor cannot determine the **Time since last update** (for example, because the list of updates is empty), it will show the value **-1s** and turn into a **Warning** status.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

**Note:** We recommend setting the [scanning interval](#)<sup>1525</sup> of this sensor to at least 12 hours to limit the load on the server being monitored.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>2050</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Requirement: Remote PowerShell

The Windows Updates Status (Powershell) sensor uses PowerShell commands. In order to monitor devices with this sensor, **Remote PowerShell** access has to be enabled on the target computer. For detailed information, please see [More](#)<sup>589</sup> section below.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	<p>The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a><sup>1839</sup>.</p>
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a><sup>1817</sup>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>159</sup> to choose an object on which the current sensor will be dependent on.</p>

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.188 WMI Custom Sensor

The WMI Custom Sensor performs a custom query via Windows Management Instrumentation (WMI).

**Note:** Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Custom Query Specific	
Channel Name	Enter a name for the channel in which the received data will be presented. The name will be displayed in graphs and tables. Please enter a string. You can change the name later in the sensor's <a href="#">channel settings</a> <sup>[1709]</sup> .
WQL File	Select a file that will be used for this sensor from the drop down menu. It will be executed with every scanning interval. The menu contains WQL scripts from the <b>\Custom Sensors\WMI WQL scripts</b> sub folder of your PRTG installation. Please store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see <a href="#">Data Storage</a> <sup>[2074]</sup> section. <b>Note:</b> Your query must return an integer or float value. Strings are not supported!

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Custom Query Specific	
Namespace	Enter the namespace for the query.
WQL File	Shows the WQL file that is executed by the sensor with every scanning interval. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable <#PH1> or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable <#PH2> or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable <#PH3> or leave the field empty.

Custom Query Specific	
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>
Channel Name	Enter a name for the channel in which the received data will be presented. The name will be displayed in graphs and tables. Please enter a string.
Unit String	Enter a unit for the data that will be received by your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.
Multiplication	Define with which value the received values will be multiplied by. By default, this is set to 1 in order to not change the received values. Please enter an integer, a decimal value, or leave the field empty.
Division	Define with which value the received values will be divided by. By default, this is set to 1 in order to not change the received values. Please enter an integer, a decimal value, or leave the field empty.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

Knowledge Base: How do I properly configure a WMI custom sensor?

- <http://kb.paessler.com/en/topic/163>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.189 WMI Custom String Sensor

The WMI Custom String sensor performs a custom string query via Windows Management Instrumentation (WMI).

**Note:** Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

Custom Query Specific	
Channel Name	Enter a name for the channel in which the received data will be presented. The name will be displayed in graphs and tables. Please enter a string. You can change the name later in the sensor's <a href="#">channel settings</a> <sup>[1709]</sup> .
WQL File	Select a file that will be used for this sensor from the drop down menu. It will be executed with every scanning interval. The menu contains WQL scripts from the <b>\Custom Sensors\WMI WQL scripts</b> sub folder of your PRTG installation. Please store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see <a href="#">Data Storage</a> <sup>[2074]</sup> section.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Custom Query Specific	
Namespace	Enter the namespace for the query.
WQL File	Shows the name of the file that this sensor is using. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable <#PH1> or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable <#PH2> or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable <#PH3> or leave the field empty.

Custom Query Specific	
If Value Changes	<p>Define what shall be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>
Channel Name	Enter a name for the channel in which the received data will be presented. The name will be displayed in graphs and tables. Please enter a string.
Unit String	Enter a unit for the data that will be received by your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.
Multiplication	Define with which value the received values will be multiplied by. By default, this is set to 1 in order to not change the received values. Please enter an integer, a decimal value, or leave the field empty.
Division	Define with which value the received values will be divided by. By default, this is set to 1 in order to not change the received values. Please enter an integer, a decimal value, or leave the field empty.
Response Must Include	Define which string must be part of the data that is received from the WMI object. You can either enter plain text or a <a href="#">Regular Expression</a> <sup>2048</sup> . If the data does not include the search pattern, the sensor will be set to an error state. Please enter a string or leave the field empty.
Response Must Not Include	Define which string must <b>not</b> be part of the data that is received from the WMI object. You can either enter plain text or a <a href="#">Regular Expression</a> <sup>2048</sup> . If the data does include the search pattern, the sensor will be set to an error state. Please enter a string or leave the field empty.
For Keyword Search Use	<p>Define in which format you have entered the search expression in the field above.</p> <ul style="list-style-type: none"> <li>▪ <b>Plain Text:</b> Search for the string as plain text. The characters <b>*</b> and <b>?</b> work here as placeholder, whereas <b>*</b> stands for no or any number of characters and <b>?</b> stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.</li> </ul>

Custom Query Specific	
	<ul style="list-style-type: none"> <li>▪ <b>Regular Expression:</b> Treat the search pattern as a <a href="#">Regular Expression</a> <sup>2048</sup>.</li> </ul>
Maximum Length of String	Define the maximum allowed length of the string that will be received from the WMI object. If it is longer than this value, the sensor will be set to an error status. Please enter an integer value or leave the field empty.
Extract Number Using Regular Expression	<p>Define if you want to filter out a numeric value from the string received from the WMI object. You can convert this into a float value, in order to use it with channel limits (see <a href="#">Sensor Channels Settings</a> <sup>1709</sup>).</p> <ul style="list-style-type: none"> <li>▪ <b>No extraction:</b> Do not extract a float value. Use the result as a string value.</li> <li>▪ <b>Extract a numeric value using a regular expression:</b> Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below. See also the <a href="#">example</a> <sup>1543</sup> below.</li> </ul>
Regular Expression	This setting is only visible if number extraction is enabled above. Enter a <a href="#">Regular Expression</a> <sup>2048</sup> to identify the numeric value you want to extract from the string returned by the WMI object. You can use capturing groups here. Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.
Index of Capturing Group	This setting is only visible if number extraction is enabled above. If your regular expression uses capturing groups, please specify which one will be used to capture the number. Please enter an integer value or leave the field empty.
Decimal Separator	This setting is only visible if number extraction is enabled above. Define which character is used as decimal separator for the number extracted above. Please enter a string or leave the field empty.
Thousands Separator	This setting is only visible if number extraction is enabled above. Define which character is used as thousands separator for the number extracted above. Please enter a string or leave the field empty.
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> </ul>

**Custom Query Specific**

- **Write sensor result to disk (Filename: "Result of Sensor (ID).txt"):** Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#)<sup>[2074]</sup> section.

**Sensor Display****Primary Channel**

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. **Note:** You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

**Chart Type**

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. **Note:** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#)<sup>[1709]</sup> settings).

**Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Example: Number Extraction with Regular Expression

If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on **1 (not on 0)**. Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number **3.555**, i.e., the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).* (\d+\.\d+).* (\d+\.\d+)
```

As **Index of Capturing Group** enter **3**. This will extract the desired number 3.555.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains "3.49%), 1 Min (3.555), 5 Min (3.90"
- Group 2 contains "3.49"
- Group 3 contains "3.555"
- Group 4 contains "3.90"

Please keep in mind this note about index and capturing groups when using number extraction.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.190 WMI Event Log Sensor

The WMI Event Log sensor monitors a specific Windows log file using Windows Management Instrumentation (WMI). It shows the number of new records (volume), the number of new records per second (speed), and it returns the last message in the sensor status.

You can set the sensor to a desired status individually according to a new event log entry. For details and how to find out the correct filter, see section [More](#)<sup>[155]</sup>.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one log file, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI Event Log Monitor	
Log File	The Windows event log provides several different log files. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

WMI Event Log Monitor	
Log file	Shows the Windows log file that this sensor will monitor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Filter Event Log Entries	
Event Type	<p>Specify the type of event that will be considered by this sensor. Other event type will not be processed. Choose between the following event types:</p> <ul style="list-style-type: none"> <li>▪ Any</li> <li>▪ Error</li> <li>▪ Warning</li> <li>▪ Information</li> <li>▪ Security Audit Success</li> <li>▪ Security Audit Failure</li> </ul>
Filter by Source	Filter all received events for a certain event source. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:

Filter Event Log Entries	
	<ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event source.</li> <li>• <b>On:</b> Enable filtering by event source.</li> </ul>
Match String (Event Source)	This field is only visible if filtering is enabled above. Enter a source from which the events are to come from. Only events from a source matching this string will be regarded, others ignored. Please enter a string.
Filter by ID	<p>Filter all received events for a certain event ID. If enabled, only messages matching the defined value(s) will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event ID.</li> <li>• <b>On:</b> Enable filtering by event ID.</li> </ul>
Match Value (Event ID)	This field is only visible if filtering is enabled above. Enter one or more event IDs (comma separated) from which the events are to come from. Only events with an ID matching one of the values will be regarded. Please enter one integer value or more comma separated integer values.
Filter by Category	<p>Filter all received events for a certain event category. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event category.</li> <li>• <b>On:</b> Enable filtering by event category.</li> </ul>
Match String (Event Category)	This field is only visible if filtering is enabled above. Enter a category which the events are to have. Only events with a category matching this string will be regarded. Please enter a string.
Filter by Event User	<p>Filter all received events for a certain event user. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event user.</li> <li>• <b>On:</b> Enable filtering by event user.</li> </ul>
Match String (Event User)	This field is only visible if filtering is enabled above. Enter a user name which the event are to be assigned to. Only events with a user name matching this string will be regarded. Please enter a string.

Filter Event Log Entries	
Filter by Event Computer	<p>Filter all received events for a certain event computer. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event computer.</li> <li>• <b>On:</b> Enable filtering by event computer.</li> </ul>
Match String (Event Computer)	<p>This field is only visible if filtering is enabled above. Enter a computer name which the events are to be assigned to. Only events with a computer name matching this string will be regarded. Please enter a string.</p>
Filter by Event Message	<p>Filter all received events for a certain event message. If enabled, only messages matching the defined value will be considered by the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Off:</b> Do not filter by event message.</li> <li>• <b>On:</b> Enable filtering by event message.</li> </ul>
Match String (Event Message)	<p>This field is only visible if filtering is enabled above. Enter a message which the event must contain. Only events with a message matching this string will be regarded. Please enter a string.</p>

**Note:** For the **WMI Event Log Sensor**, you can use the percent sign (%) as placeholder for any or no character (as known from the asterisk sign (\*)) in Windows search) in combination with a substring. For example, you can enter %RAS% for any event source containing the string RAS.

Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#) <sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#) <sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## More

- <http://kb.paessler.com/en/topic/59803>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.191 WMI Exchange Server Sensor

The WMI Exchange Server sensor monitors a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI). It can show information about the queue, delivery time, latency, users, etc.

**Note:** Existing former "WMI Exchange Server 2003/2007 Sensors" from previous PRTG versions will continue to monitor your Exchange server in PRTG 9, but newly added Exchange server sensors will be of the "WMI Exchange Server Sensor" type which is able to monitor Exchange servers regardless of their version.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor an Exchange Server, PRTG will create one sensor for each performance counter you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### Exchange Server Data Readings Accessible Using WMI

##### Performance Counter

You see a list of data values the sensor can monitor on your Exchange server. The available options depend on your Exchange server configuration. PRTG shows all possible performance counters with name and instance description (if available). Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

You might be able to select aspects regarding:

- **SMTP Server:** Queue Lengths

**Exchange Server Data Readings Accessible Using WMI**

- **MSExchangeIS Mailbox:** Queue Sizes, Delivery Times, Operations, Messages
- **MSExchangeIS Public:** Queue Sizes, Delivery Times, Operations, Messages
- **MSExchangeIS:** Packets, Operations, Clients, Latency, Requests, Users
- **MS Exchange RPC Client Access:** Active User Count, User Count, Connection Count
- **MS Exchange OWA:** Current Unique Users, Average Response Time

**Note:** Depending on your Exchange server version, not all counters might be available.

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Readings Accessible Using WMI	
Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (System)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>

### Sensor Display

#### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

#### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

#### Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

#### Maintenance Window

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.192 WMI Exchange Transport Queue Sensor

The WMI Exchange Server sensor monitors the length of transport queues of a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI). It shows the same information as shown in Windows System Monitor ('perfmon'). See section [More](#)<sup>[1565]</sup> below for an explanation of the transport queue types.

Possible values that can be monitored: Active Mailbox Delivery Queue Length, Active Non-Smtp Delivery Queue Length, Active Remote Delivery Queue Length, Aggregate Delivery Queue Length (All Queues), Aggregate Shadow Queue Length, Categorizer Job Availability, Items Completed Delivery Per Second, Items Completed Delivery Total, Items Deleted By Admin Total, Items Queued For Delivery Expired Total, Items Queued for Delivery Per Second, Items Queued For Delivery Total, Items Resubmitted Total, Largest Delivery Queue Length, Messages Completed Delivery Per Second, Messages Completed Delivery Total, Messages Completing Categorization, Messages Deferred Due To Local Loop, Messages Deferred during Categorization, Messages Queued For Delivery, Messages Queued for Delivery Per Second, Messages Queued For Delivery Total, Messages Submitted Per Second, Messages Submitted Total, Poison Queue Length, Retry Mailbox Delivery Queue Length, Retry Non-Smtp Delivery Queue Length, Retry Remote Delivery Queue Length, Shadow Queue Auto Discards Total, Submission Queue Items Expired Total, Submission Queue Length, Unreachable Queue Length.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one queue, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**WMI Exchange Transport Queue Specific****MSExchangeTransport Queues**

You see a list of transport queues that can be monitored on your Exchange server. The available options depend on your Exchange server configuration. PRTG shows all possible queues with name and instance description (if available). Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. **Note:** For performance reasons, we recommend to only select necessary items!

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings****Sensor Name**

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Tags**

Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. Those are not visible here.

**Priority**

Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**Readings Accessible Using WMI****Display Name****Instance****WMI Class**

These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Readings Accessible Using WMI	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (System)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>[2074]</sup> section.</li> </ul>
Sensor Display	
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.</p>
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>[1709]</sup> settings).</li> </ul>
Stack Unit	<p>This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.193 WMI File Sensor

The WMI File monitors a file using Windows Management Instrumentation (WMI). It shows the file size and the last modified date.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

WMI File Monitor	
File name	Enter the name of the file that this sensor will check. Please enter a full local path. The file must exist on the computer your local or remote probe is running on; UNC paths are not allowed here. For example, when creating this sensor on a device under the local probe, the file be accessible on the local system.
If timestamp changes	<p>Define what shall be done in case the timestamp of the file changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'On Change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a> <sup>1716</sup> whenever the sensor value changes.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Schedules, Dependencies, and Maintenance Window	
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.194 WMI Free Disk Space (Multi Drive) Sensor

The WMI Free Disk Space (Multi Drive) sensor monitors the free disk space of one or multiple drive(s) using Windows Management Instrumentation (WMI). It shows the space in percent and total. One single sensor is used for all drives; the data is presented in different channels.

This sensor monitors logical partitions of a hard or fixed disk drive. PRTG identifies logical disks by their drive letter, such as C.

**Note:** This sensor is also supported on Windows XP and earlier.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### WMI Volume Specific

Drive	From the drop down menu, select the drive(s) you want to monitor. We recommend using the default value. You can choose <b>All</b> to monitor all available drives or you can choose one specific drive letter to monitor this single drive only. The data in the drop down menu may also contain drive letters that do not exist on your device. The drive setting cannot be changed once the sensor is created.
-------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### WMI Disk Free Configuration

Drive	Shows the drive(s) that this sensor is monitoring; either <b>All</b> or a specific drive letter. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
-------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Set limits checked against ALL disks

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status; depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor's **Channels** settings.

**Note:** All limits defined here are valid additionally to the limits defined in the particular **Channels** settings!

Percentage Limit Check	<p>Enable or disable a limit check for the free space in percentage channels of all drives. By default percentage limits are enabled with lower warning and lower error limit. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Percentage Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Percentage Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when free space limits are undercut or overrun.</li> </ul>
------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Set limits checked against ALL disks	
Upper Error Limit	This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Down</b> status. If the free disk space of one of your drives overruns this percent value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if percentage limit check is enabled above. Specify an upper limit in percent for a <b>Warning</b> status. If the free disk space of one of your drives overruns this percent value, the sensor will be set to <b>Warning</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for a warning state. If the free disk space of one of your drives undercuts this percent value, the sensor will be set to warning. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if percentage limit check is enabled above. Specify a lower limit in percent for entering a <b>Down</b> status. If the free disk space of one of your drives undercuts this percent value, the sensor will be set to <b>Down</b> . Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> . The limits set here and in the channel settings are valid simultaneously!
Byte Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives. Choose between:</p> <ul style="list-style-type: none"> <li>• <b>Disable Byte Limits:</b> Do not use the drives' data to control the sensor's status.</li> <li>• <b>Enable Byte Limits:</b> Define limits. Additional fields appear below. The sensor will enter a warning or down state when free space limits are undercut or overrun.</li> </ul>

Set limits checked against ALL disks	
Upper Error Limit	<p>This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will be set to <b>Down</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Upper Warning Limit	<p>This field is only visible if byte limit check is enabled above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor will be set to <b>Warning</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Lower Warning Limit	<p>This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor will be set to <b>Warning</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Lower Error Limit	<p>This field is only visible if byte limit check is enabled above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor will be set to <b>Down</b>. Please enter an integer value or leave the field empty. <b>Note:</b> The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup>. The limits set here and in the channel settings are valid simultaneously!</p>
Alarm on Missing/ Removed Disk	<p>If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Deactivate alarm (default):</b> Select this option if you do not want an alarm for a removed disk.</li> <li>▪ <b>Activate Alarm:</b> Select this option if you want to be alerted if a monitored disk is removed.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

## Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.195 WMI HDD Health Sensor

This sensor type connects to the parent device via Windows Management Instrumentation (WMI) and monitors the health of IDE disk drives on the target system, using Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.). This is built into most modern IDE hard disk drives.

**Note:** This sensor officially requires Windows Vista or later running on the target machine which holds the hard disk drives you want to monitor. The sensor may **not** work reliably when the target machine runs on Windows 2003 or Windows XP; due to a known bug in those systems, the sensor may not be able to detect available hard disk drives.

Available sensor channels may vary, depending on the hardware used on the target system. Available measurements may include: Read Error Rate, Spin-Up Time, Start/Stop Count, Reallocated Sectors Count, Seek Error Rate, Power-On Hours, Spin Retry Count, Calibration Retry Count, Power Cycle Count, Power-off Retract Count, Load Cycle Count, Temperature Celsius, Reallocation Event Count, Current Pending Sector Count, Uncorrectable Sector Count, UltraDMA CRC Error Count, Write Error Rate, Transfer Error Rate, Total LBAs Written, and Total LBAs Read.

The channel names indicate the ID of the channel, followed by a colon, and the typical meaning of the channel. **Note:** Some vendors define meanings other than the common one.

Every attribute of a disk assumes a value. PRTG shows these attributes as channels with their last, minimum, and maximum value. These channel values change over time and indicate the disk health—higher values correspond to a better health. The disk's attributes come with a threshold, defined by the manufacturer of the drive. If a channel value is lower than this threshold, the sensor is automatically set to a **Warning** status. This indicates that the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status of the HDD might break soon. **Note:** For some attributes are no thresholds defined and thus cannot be judged for a status other than **Up**.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor the health of a disk, PRTG will create one sensor for each IDE device you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SMART Specific	
IDE Devices	Please select one or more hard disks you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. . The items shown in the list are specific to the parent device you create the sensor on.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

SMART Specific	
Serial No.	Shows the serial number of the monitored disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SMART Specific	
Size (GB)	Shows the size in Gigabyte of the monitored disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the monitored disk. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Timeout (sec)	Enter a timeout in seconds for the request. If the reply takes longer than this value the request is aborted and an error message is triggered.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.196 WMI Logical Disk Sensor

The WMI Logical Disk sensor monitors parameters of a logical disk of a Windows device using Windows Management Instrumentation (WMI). It shows disk read/write time, queue, free space, etc. on logical partitions of a disk drive.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[205]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### WMI Logical Disk Specific

##### Logical Disks

You see a list showing the **Name** of the counters you can monitor as well as the **Instance**, i.e. the respective logical disk (or '\_Total'). If there are no logical disks available, you will see a corresponding message. From the list, choose all **Name/Instance** combinations you want to monitor by adding a check mark in front of the respective line (for example, choose '% Disk Read Time for C:'). For each selection one sensor will be created using the defined settings.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### Readings Accessible Using WMI

Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (System)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.197 WMI Memory Sensor

The WMI Memory sensor monitors available (free) system memory on Windows systems using Windows Management Instrumentation (WMI).

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

WMI Alternative Query	
Errors and invalid data	This is an extended help field only. PRTG's WMI sensors are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do that in the future) some WMI classes over the various Windows/ServicePack/patchlevel versions, resulting in errors like "class not valid" or "invalid data". Wherever possible PRTG features an alternative query that might work in your specific circumstances. When you keep getting errors for this sensor please try enabling the alternative query method below.
Alternative query	<p>Choose the method PRTG uses to query via WMI. For compatibility reasons, an alternative query method can be enabled. We recommend using the default value. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>use default</b>: Use PRTG's standard method to query WMI. This is the best setting in most cases.</li> <li>• <b>use alternative</b>: Use an alternative method to query WMI. If you keep getting errors, please try this setting.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note</b> : You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default)</b>: Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other</b>: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note</b>: This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

## Schedules, Dependencies, and Maintenance Window

## Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device it is created on is in a **Down** status, or if it is paused by another dependency.
- **Select object:** Pause the current sensor if the device it is created on is in an **Down** status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

**Note:** Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.

## Dependency

This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the [object selector](#)<sup>[159]</sup> to choose an object on which the current sensor will be dependent on.

## Delay (Seconds)

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.198 WMI Microsoft SQL Server 2005 Sensor (Deprecated)

### Important Notice

This sensor type is deprecated.

Monitoring of Microsoft SQL Server 2005 using PRTG is discontinued. It cannot be monitored with PRTG any more with the latest updates of SQL Server 2005. The reason for this is a software update delivered by Microsoft in August 2012. The following updates cause this issue:

- **Security Update for SQL Server 2005 Service Pack 4 (KB2716429)**
- **Security Update for SQL Server 2005 Service Pack 4 (KB2716427)**

We have made reasonable effort to fix this from our side but we were unable to. We do not have instructions to circumvent this issue at this time. Please ask the vendor to fix this.

### More

Knowledge Base: Why does my WMI Microsoft SQL Server 2005 Sensor not work anymore?

- <http://kb.paessler.com/en/topic/44713>

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels actually available for a sensor depend on which performance counters you choose during setup.

### Channel Overview

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.

Channel Overview	
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.
Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

Channel Overview	
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

**Note:** This sensor can only be added to a device (computer) running a Microsoft SQL database.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>77</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>2050</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>1959</sup> section.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>220</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL Server Settings	
MS SQL Server Instance	You see a list of all server instances available on the device. Display name and service name are provided as returned by the SQL server. Please choose one or more instances by adding a check mark in front of the respective line. For each instance one sensor will be created.

SQL Server Settings	
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.
SQL Counter Specific	
SQL Performance Counters	<p>You see a list of different performance counters which can be monitored for the instance(s) selected above. The sensors created for the server instances will all monitor the performance counter you select here. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>General Statistics:</b> Read general performance counters. This will show the number of user connections, and the number of logins and logouts per second.</li> <li>▪ <b>Access Methods:</b> Read access method counters. This will show the number of full scans, page splits, and table lock escalations, per second.</li> <li>▪ <b>Buffer Manager:</b> Read buffer manager counters. This will show the buffer cache hit ratio in percent, and the number of database pages and stolen pages.</li> <li>▪ <b>Memory Manager:</b> Read memory manager counters. This will show the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory, in KB.</li> <li>▪ <b>Locks:</b> Read locks counters. This will show the number of lock requests and deadlocks, per second, and the average wait time.</li> <li>▪ <b>SQL Statistics:</b> Read SQL statistics. This will show the number of batch requests, SQL compilations, and SQL re-compilations, per second.</li> </ul> <p>Depending on your selection, a sensor with the specified channels will be created. <b>Note:</b> In order to monitor several performance counters for an instance, please add the sensor several times.</p>

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
SQL Server Settings	
Service	Shows the service monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	<p>Select whether PRTG will select the name of the WMI class used for monitoring automatically. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic:</b> Choose WMI class automatically. This is the recommended setting.</li> <li>▪ <b>Manual:</b> Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.</li> </ul>
WMI Class	This field is only shown if manual WMI class selection is enabled above. This setting is intended for experienced users only. Enter the WMI class name that will be used for monitoring your server instance.
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> </ul>

### SQL Server Settings

- **Write sensor result to disk (Filename: "Result of Sensor (ID).txt"):** Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see [Data Storage](#)<sup>[2074]</sup> section.

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

### Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>[224]</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

## Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

### 6.8.199 WMI Microsoft SQL Server 2008 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels actually available for a sensor depend on which performance counters you choose during setup.

Channel Overview	
User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

Channel Overview	
Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

**Note:** This sensor can only be added to a device (computer) running a Microsoft SQL database.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL Server Settings	
MS SQL Server Instance	You see a list of all server instances available on the device. Display name and service name are provided as returned by the SQL server. Please choose one or more instances by adding a check mark in front of the respective line. For each instance one sensor will be created.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.
SQL Counter Specific	
SQL Performance Counters	<p>You see a list of different performance counters which can be monitored for the instance(s) selected above. The sensors created for the server instances will all monitor the performance counter you select here. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>General Statistics:</b> Read general performance counters. This will show the number of user connections, and the number of logins and logouts per second.</li> <li>▪ <b>Access Methods:</b> Read access method counters. This will show the number of full scans, page splits, and table lock escalations, per second.</li> <li>▪ <b>Buffer Manager:</b> Read buffer manager counters. This will show the buffer cache hit ratio in percent, and the number of database pages and stolen pages.</li> <li>▪ <b>Memory Manager:</b> Read memory manager counters. This will show the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory, in KB.</li> <li>▪ <b>Locks:</b> Read locks counters. This will show the number of lock requests and deadlocks, per second, and the average wait time.</li> <li>▪ <b>SQL Statistics:</b> Read SQL statistics. This will show the number of batch requests, SQL compilations, and SQL re-compilations, per second.</li> </ul>

### SQL Counter Specific

Depending on your selection, a sensor with the specified channels will be created. **Note:** In order to monitor several performance counters for an instance, please add the sensor several times.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### SQL Server Settings

Service	Shows the service monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG will select the name of the WMI class used for monitoring automatically. Choose between:

SQL Server Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Automatic:</b> Choose WMI class automatically. This is the recommended setting.</li> <li>▪ <b>Manual:</b> Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.</li> </ul>
WMI Class	This field is only shown if manual WMI class selection is enabled above. This setting is intended for experienced users only. Enter the WMI class name that will be used for monitoring your server instance.
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor (ID).txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.200 WMI Microsoft SQL Server 2012 Sensor

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels actually available for a sensor depend on which performance counters you choose during setup.

Channel Overview	
User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

Channel Overview	
Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.

**Note:** This sensor can only be added to a device (computer) running a Microsoft SQL database.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL Server Settings	
MS SQL Server Instance	You see a list of all server instances available on the device. Display name and service name are provided as returned by the SQL server. Please choose one or more instances by adding a check mark in front of the respective line. For each instance one sensor will be created.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.
SQL Counter Specific	
SQL Performance Counters	<p>You see a list of different performance counters which can be monitored for the instance(s) selected above. The sensors created for the server instances will all monitor the performance counter you select here. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>General Statistics:</b> Read general performance counters. This will show the number of user connections, and the number of logins and logouts per second.</li> <li>▪ <b>Access Methods:</b> Read access method counters. This will show the number of full scans, page splits, and table lock escalations, per second.</li> <li>▪ <b>Buffer Manager:</b> Read buffer manager counters. This will show the buffer cache hit ratio in percent, and the number of database pages and stolen pages.</li> <li>▪ <b>Memory Manager:</b> Read memory manager counters. This will show the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory, in KB.</li> <li>▪ <b>Locks:</b> Read locks counters. This will show the number of lock requests and deadlocks, per second, and the average wait time.</li> <li>▪ <b>SQL Statistics:</b> Read SQL statistics. This will show the number of batch requests, SQL compilations, and SQL re-compilations, per second.</li> </ul>

### SQL Counter Specific

Depending on your selection, a sensor with the specified channels will be created. **Note:** In order to monitor several performance counters for an instance, please add the sensor several times.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### SQL Server Settings

Service	Shows the service monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG will select the name of the WMI class used for monitoring automatically. Choose between:

SQL Server Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Automatic:</b> Choose WMI class automatically. This is the recommended setting.</li> <li>▪ <b>Manual:</b> Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.</li> </ul>
WMI Class	This field is only shown if manual WMI class selection is enabled above. This setting is intended for experienced users only. Enter the WMI class name that will be used for monitoring your server instance.
Sensor Result	<p>Define what will be done with the results the sensor receives. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor (ID).txt"):</b> Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.201 WMI Process Sensor

The WMI Process sensor monitors a Windows process using Windows Management Instrumentation (WMI). It shows the absolute working set and commit size, the number of threads and handles, as well as the average CPU usage (if there are multiple instances running) and the total CPU usage of the process.

For the "total CPU usage" value of a process, all CPU usage values are summed up. The total is divided by the number of all CPUs; the maximum value is 100%. This corresponds to the CPU usage of all instances of this specific process. Regarding the "per instance" value, the summed up CPU usage value is divided by the number of all instances. It shows the average CPU usage of a single instance of the process on one CPU.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[205]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**WMI Process Monitor**

Executable	Enter the name of the process that will be monitored. Please enter the name of an executable file without the <b>.exe</b> extension. The sensor will be set to an error state if the process is not active on the device.
------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <small>1709</small> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

### Schedules, Dependencies, and Maintenance Window

Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.202 WMI Remote Ping Sensor

The WMI Remote Ping sensor connects remotely to a Windows system using Windows Management Instrumentation (WMI), then performs an Internet Control Message Protocol (ICMP) echo request ("Ping") from this device to a specified target. The sensor shows the Ping time from the remote device to the target device that is being pinged.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[200]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

WMI Remote Ping Configuration	
Target	Enter the DNS name or IP address of the target device the Ping is sent to. The sensor will remotely connect to the parent device it is created on via WMI, then perform a Ping request from this remote device to the target device/server. Please enter a string.
Timeout (Seconds)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value the request is aborted and an error message is triggered. Please enter an integer value. The maximum is 300.
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000. Please enter an integer value. We recommend using the default value.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) <sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#) <sup>94</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#) <sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#) <sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#) <sup>142</sup> section.

## 6.8.203 WMI Security Center Sensor

The WMI Security Center sensor monitors the security status of a Windows computer using Windows Management Instrumentation (WMI). It can monitor all security products that are controlled by Windows Security Center / Windows Action Center. It returns a status code of the monitored product and sets the sensor status to **Warning** if a product status is unknown, if it is reported as out of date, or if the access scan is disabled. A sensor status showing **Up** indicates that the product is up to date and the access scan is running.

Possible return values for status codes are:

Status Code	Meaning: Status of Monitored Security Product Is ...	Will Result in Sensor Status
0	Unknown	Warning
1	Not running, Out of date	Warning
2	Running, Out of date	Warning
3	Not running, Up to date	Warning
4	Running, Up to date	OK

**Note:** This sensor requires Windows XP SP2 or later on the target computer. The Windows Security Center / Windows Action Center is only available on client Windows versions.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**WMI Security Center Specific****Security Center Products**

You see a list showing the **Name** and **Type** of all security products found in the Windows Security Center on the target device. If there are no products, you will see a corresponding message. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings****Sensor Name**

Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.

**Tags**

Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically [inherited](#) from objects further up in the device tree. Those are not visible here.

**Priority**

Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**WMI Security Center Specific****Display Name**

Shows the name of the product monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

**Type**

Shows the type of the product monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

**WMI Security Center Specific****If Value Changes**

Define what will be done in case the value of this sensor changes. You can choose between:

- **Ignore changes:** No action will be taken on change.
- **Trigger 'change' notification:** The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) <sup>1716</sup> whenever the sensor value changes.

**Sensor Display****Primary Channel**

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. **Note:** You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

**Chart Type**

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. **Note:** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) <sup>1709</sup> settings).

**Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

### Schedules, Dependencies, and Maintenance Window

	<ul style="list-style-type: none"> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>941</sup>.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.204 WMI Service Sensor

The WMI Service sensor monitors a Windows service using Windows Management Instrumentation (WMI). It shows the execution time of the monitoring request. Additionally, it can show CPU and pagefile usage, the number of handles and threads, and the working set of the monitored service. You can monitor these channels if you enable **Monitor extended values** in the sensor settings.

**Note:** The "Running (msec)" channel of this sensor shows the execution time of the monitoring request. It does **not** refer to the time the Windows service has been running! As of PRTG version 13, the name of this sensor channel is **Sensor Execution Time**.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one service multiple sensors are created at once in the **Add Sensor** dialog.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI Service Monitor	
Service	A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. Name and description are provided in the language of the device's Windows installation. Later on, a sensor's status will be set to <b>Down</b> if the service is not running.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
WMI Service Monitor	
If Service is Not Running	<p>Select whether the service will be (re-)started if it is stopped or paused. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Start/Restart service (default):</b> PRTG will try to start the service if it is not running when scanning the device.</li> <li>▪ <b>Do nothing:</b> PRTG will not start any service on the device automatically.</li> </ul>
Monitoring	<p>Select whether you want to monitor CPU usage and other useful performance counters. This may cause a "Class not found" error on some Windows systems. If you do not monitor these counters, the value '0' is returned for these channels. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Just check if services is running:</b> PRTG will only monitor the channel "Sensor Execution Time".</li> <li>▪ <b>Monitor extended values:</b> PRTG will monitor also other useful performance counters.</li> </ul>
Service	Shows the Windows service this sensor will monitor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI Service Monitor	
Description	Shows the description for the service. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the sensor result.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: <b>Result of Sensor [ID].txt</b>. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</li> </ul>
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

**Schedules, Dependencies, and Maintenance Window****Dependency Type**

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent:** Pause the current sensor if the device it is created on is in a **Down** status, or if it is paused by another dependency.
- **Select object:** Pause the current sensor if the device it is created on is in an **Down** status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent:** Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

**Note:** Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.

**Dependency**

This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the [object selector](#)<sup>[159]</sup> to choose an object on which the current sensor will be dependent on.

**Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.205 WMI Share Sensor

The WMI Share sensor monitors a shared resource on a Windows system using Windows Management Instrumentation (WMI). It shows the availability; you can set a sensor to **Down** status for different share status messages.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[205]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one share multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI Shared Resource	
Share	Select the shares you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. <b>Note:</b> In order to provide any shares, the <b>LanmanServer</b> "Server" Windows service must be running on the target computer. If it is not, there are no shares and you will see a <b>No Share available</b> message here.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

**WMI Shared Resource**

Shared Resource	Shows information about the shared resource monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
Type	
TypeID	

**Trigger Errorstate on following conditions**

Select under which conditions the sensor will change to a **Down** status from the list below. As long as the share returns OK, the sensor status will be **Up**. Choose a **Down** condition by adding a check mark symbol in front of the according line. Please choose none, one, or several from the following conditions. Note: While in Down status, a sensor does not record any data in all of its channels.

Error	Set sensor to <b>Down</b> status if the share returns an error status. A share in this status is not operational.
Degraded	Set sensor to <b>Down</b> status if the share returns a degraded status. A share in this status is still operational.
Unknown	Set sensor to <b>Down</b> status if the share returns an unknown status.

Trigger Errorstate on following conditions	
Pred Fail	Set sensor to <b>Down</b> status if the share returns a "predicted fail" status. This indicates that an element is functioning properly but is predicting a failure (for example, a SMART-enabled hard drive). A share in this status is still operational.
Starting	Set sensor to <b>Down</b> status if the share returns a starting status. A share in this status is not operational.
Stopping	Set sensor to <b>Down</b> status if the share returns a stopping status. A share in this status is not operational.
Service	Set sensor to <b>Down</b> status if the share returns a service status. This can apply during disk mirror-resilvering, reloading a user permissions list, or other administrative work on the monitored device. Not all such work is online, but the managed element is neither OK nor in one of the other states. A share in this status is not operational.
Stressed	Set sensor to <b>Down</b> status if the share returns a stressed status.
Nonrecover	Set sensor to <b>Down</b> status if the share returns a "non recover" status.
NoContact	Set sensor to <b>Down</b> status if the share returns a "no contact" status.
LostComm	Set sensor to <b>Down</b> status if the share returns "lost communication" status.
Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> </ul>

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

**Edit Sensor Channels**

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[170]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.206 WMI SharePoint Process Sensor

The WMI SharePoint Process sensor monitors a Microsoft SharePoint server using Windows Management Instrumentation (WMI). It shows the number of current page requests, active threads, and SQL queries currently executed, as well as global heap size, object cache always live size, template cache size, and CPU utilization.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[206]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

If you select more than one SharePoint process, multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI Process Monitor	
SharePoint Processes	You see a list of all SharePoint processes running on this device. There is also a "_Total" process available. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

### Basic Sensor Settings

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

### WMI Process Monitor

SharePoint Process	The name of the SharePoint process that is monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
--------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[170]</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree.  
Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Channel Unit Configuration

### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.207 WMI Terminal Services (Windows 2008) Sensor

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI). It shows the number of active and total sessions. Active sessions are sessions with a currently logged in user; inactive sessions (included in total) can be sessions with a disconnected user that has not logged out, or system services using a session. **Note:** As "Total Sessions", this sensor type will return the number of the active sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.

**Note:** Depending on the OS that will be monitored, please select either the sensor for Windows XP/Vista/2003 or the one for Windows 2008.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[205]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

### Basic Sensor Settings

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Sensor Display

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

### Scanning Interval

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>94</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.208 WMI Terminal Services (Windows XP/Vista/2003) Sensor

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI). It shows the number of active and total sessions. Active sessions are sessions with a currently logged in user; inactive sessions (included in total) can be sessions with a disconnected user that has not logged out, or system services using a session. **Note:** As "Total Sessions", this sensor type will return the number of the active sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.

**Note:** Depending on the OS that will be monitored, please select either the sensor for Windows XP/Vista/2003 or the one for Windows 2008.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.

**Basic Sensor Settings**

Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).
----------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Display**

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval**

Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
-------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Schedules, Dependencies, and Maintenance Window

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>941</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.209 WMI UTC Time Sensor

The WMI UTC Time sensor monitors the UTC time of a target device using Windows Management Instrumentation (WMI). It shows the UTC time of the target device, and the time difference between the PRTG system time and the target device, in seconds.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[205]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[195]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	

Schedules, Dependencies, and Maintenance Window	
Schedule	<p>Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <small>1817</small>. <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.</p>
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.</p>
Maintenance End At	<p>This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.</p>
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.8.210 WMI Vital System Data (V2) Sensor

The WMI Vital System Data sensor monitors vital system parameters (CPU, system, memory, disk, network, pagefile, etc.) using Windows Management Instrumentation (WMI).

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

#### Vital System Data Readings Accessible Using WMI

##### Performance Counter

You see a list of available vital system data values the sensor can monitor on the target device. The available options depend on your configuration. PRTG shows all possible performance counters with name and instance description (if available). Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

You can choose between the following counters:

- CPU
- Thread
- Memory
- Network
- Pagefile

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Readings Accessible Using WMI	
Display Name	These fields show the parameters that are used to query data for this sensor from the target device. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Instance	
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	<p>Define what will be done with the result of the sensor. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Discard sensor result:</b> Do not store the results.</li> <li>▪ <b>Write sensor result to disk (Filename: "Result of Sensor [ID].txt"):</b> Store the last result received to the "Logs (System)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see <a href="#">Data Storage</a><sup>[2074]</sup> section.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .

Schedules, Dependencies, and Maintenance Window	
<p><b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.</p>	

Schedules, Dependencies, and Maintenance Window	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul>

Schedules, Dependencies, and Maintenance Window	
	<p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a><sup>[94]</sup>.</p>

### Channel Unit Configuration

#### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

### Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

### Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

### Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.211 WMI Volume Sensor

The WMI Volume sensor monitors the free disk space on one drive or one logical volume using Windows Management Instrumentation (WMI). It shows the space in percent and total. For each drive or logical volume, one sensor is used.

This sensor monitors an area of storage on a hard disk. It can monitor local volumes that are formatted, unformatted, mounted, or offline. A volume is formatted by using a file system, such as File Allocation Table (FAT) or New Technology File System (NTFS), and might have a drive letter assigned to it. One hard disk can have multiple volumes, and volumes can span multiple physical disks. The sensor does not support disk drive management.

**Note:** This sensor is not supported on Windows XP and earlier.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1959]</sup> section.

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[226]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

For devices with multiple volumes multiple sensors are created at once in the **Add Sensor** dialog. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI Volume Specific	
Volumes	Select the volume(s) you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

WMI Volume Specific	
DeviceID	Shows the id of the volume that this sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Drive Type	Shows the type of the drive the sensor is monitoring. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Timeout (sec)	Enter a timeout in seconds for the WMI request. If the reply takes longer than this value the request is aborted and an error message is triggered.

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor.

Sensor Display	
	<ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

Scanning Interval	
Scanning Interval	The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the <a href="#">system administration</a> <sup>1839</sup> .
Schedules, Dependencies, and Maintenance Window	
<b>Note:</b> Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.	
Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

Schedules, Dependencies, and Maintenance Window	
Maintenance Window	<p>Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>159</sup> to choose an object on which the current sensor will be dependent on.

**Schedules, Dependencies, and Maintenance Window****Delay (Seconds)**

Define a time span. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. **Note:** This setting is not available if you choose this sensor to be the **Master object for parent**. In this case, please define delays in the parent [Device Settings](#)<sup>[272]</sup> or the superior [Group Settings](#)<sup>[253]</sup>.

**Access Rights****User Group Access**

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>[186]</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>[94]</sup>.

Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"><li>▪ <b>Bandwidth</b></li><li>▪ <b>Memory</b></li><li>▪ <b>Disk</b></li><li>▪ <b>File</b></li><li>▪ <b>Custom</b></li></ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.212 WMI Volume Fragmentation Sensor

The WMI Volume Fragmentation sensor monitors the fragmentation of a logical volume via Windows Management Instrumentation (WMI). It can show if a defragmentation is recommended on the volume, the number of average fragments per file, the number of excess fragments in total, the number of fragmented files in total, and file fragmentation in percent.

**Note:** This sensor is not supported on Windows XP and earlier.

This sensor type uses lookups to determine the status values of some sensor channels. For details, please see section [Define Lookups](#)<sup>[2039]</sup>.

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[2050]</sup> for load balancing.

For a general introduction to the technology behind WMI, please see [Monitoring via WMI](#)<sup>[1969]</sup> section.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 4.0 (with latest update).

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

In order to monitor fragmentation on volumes, PRTG will create one sensor for each volume you choose. The settings you make in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

**WMI Volume Specific**

Volume	Select one or more volumes you want to add a sensor for. A list of all available items is shown with their name. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.
--------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Sensor Settings**

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

**Basic Sensor Settings**

Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

WMI Volume Specific	
DeviceID	Shows the unique identifier of the volume monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Drive Type	Shows the type of the disk drive monitored by this sensor. Once a sensor is created this value cannot be changed. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID Selection	Specify the way the volume is identified. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Use system device ID (recommended):</b> This is usually the best option for this sensor type, because the device ID will not change when the volume is renamed.</li> <li>▪ <b>Use drive letter:</b> In a Microsoft cluster environment, the device ID will change when the cluster is switched to another node. In this case, use the drive letter option to avoid issues regarding this.</li> </ul>
Drive Letter	This field is only visible when the drive letter option is selected above. Enter the letter of the drive you want to monitor followed by a trailing colon, for example, <b>C:</b> .

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how different channels will be shown for this sensor. <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>1709</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#) settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#).

## Channel Unit Configuration

### Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

**Note:** Custom channel types can be set on sensor level only.

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.213 WMI Windows Version Sensor

The WMI Windows Version sensor reads the Windows version of the parent device via Windows Management Instrumentation (WMI). It returns the version number (in a channel) as well as the according version name (in the sensor message).

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>[2050]</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>[276]</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

### Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

### Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
If Value Changes	<p>Define what will be done in case the value of this sensor changes. You can choose between:</p> <ul style="list-style-type: none"> <li>• <b>Ignore changes (default):</b> No action will be taken on change.</li> <li>• <b>Trigger 'change' notification:</b> The sensor will send an internal message indicating that its value has changed. In combination with a <b>Change Trigger</b>, you can use this mechanism to <a href="#">trigger a notification</a><sup>[1716]</sup> whenever the sensor value changes.</li> </ul>

Sensor Display	
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. <b>Note:</b> You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	<p>Define how different channels will be shown for this sensor.</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show an own graph for each channel.</li> <li>▪ <b>Stack channels on top of each other:</b> Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. <b>Note:</b> This option cannot be used in combination with manual <b>Vertical Axis Scaling</b> (available in the <a href="#">Sensor Channels Settings</a><sup>[1709]</sup> settings).</li> </ul>

**Sensor Display****Stack Unit**

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

**Inherited Settings**

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#)<sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

**Scanning Interval****Scanning Interval**

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#)<sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

**Schedule**

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the [account settings](#)<sup>1817</sup>. **Note:** Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.

**Maintenance Window**

Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between:

- **Not set (monitor continuously):** No maintenance window will be set.
- **Set up a one-time maintenance window:** Pause monitoring within a maintenance window.

Schedules, Dependencies, and Maintenance Window	
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	<p>Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a> <sup>[159]</sup> to choose an object on which the current sensor will be dependent on.
Delay (Seconds)	Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b> . In this case, please define delays in the parent <a href="#">Device Settings</a> <sup>[272]</sup> or the superior <a href="#">Group Settings</a> <sup>[253]</sup> .

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>1709</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>1716</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>142</sup> section.

## 6.8.214 WSUS Statistics Sensor

The WSUS Statistics sensor monitors various statistics on a Windows Server Update Services (WSUS) server using Windows Management Instrumentation (WMI).

It can show the number of: Approved updates, computers having update errors, computers needing updates, computers not synchronized for 7 days, computers registered, computers up to date, declined updates, expired updates, not approved critical or security updates, not approved updates, total updates, unapproved needed updates, updates needed by computers, updates needing files, updates up to date, updates with client errors, updates with server errors, updates with stale update approvals, and the number of WSUS infrastructure updates not approved for installation.

**Note:** This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend using not more than 50 sensors, on each probe, of this type of sensor.

### Requirement: .NET Framework

This sensor type requires the **Microsoft .NET Framework** to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the [remote probe](#)<sup>2050</sup>. If the framework is missing, you cannot create this sensor. **Note:** You need to install the exact version required (a higher version will usually not work; an exception applies to .NET 3.5 which comprises .NET 2.0 and .NET 3.0). Generally, it is possible to run several .NET Framework versions on the same machine side-by-side. Please install the latest update available for the required version.

Required **.NET** version: 2.0.

### Requirement: Windows Credentials

For this sensor type credentials for Windows systems must be defined for the device you want to use the sensor on. In the [parent device's](#)<sup>276</sup> **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

**Note:** If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

**Note:** Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

### Requirement: WSUS 3.0 Administration Console

In order for this sensor to work, Microsoft's **WSUS 3.0 Administration Console** must be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe.

## Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device [manually](#)<sup>[220]</sup>. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change all settings in the sensor's **Settings** tab later.

## Sensor Settings

On the sensor's details page, click on the **Settings** tab to change settings.

**Note:** If not set explicitly in a sensor's settings, it will connect to the **IP Address** or **DNS Name** defined in the settings of the parent device the sensor is created on.

Basic Sensor Settings	
Sensor Name	Enter a meaningful name to identify the sensor. The name will be shown by default in the device tree and in all alarms.
Tags	Enter one or more tags, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend using the default value. You can add additional tags to it, if you like. Other tags are automatically <a href="#">inherited</a> <sup>[89]</sup> from objects further up in the device tree. Those are not visible here.
Priority	Select a priority for the sensor. This setting determines where the sensor will be placed in sensor lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Sensor Settings	
WSUS Server Port	Define the port where the WSUS server service is running on. Default value is <b>80</b> . Please enter an integer value.
Use SSL	Define if SSL-encryption will be used for the connection to the WSUS server. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Yes</b></li> <li>▪ <b>No</b></li> </ul>
If Value Changes	Define what will be done in case the value of this sensor changes. You can choose between: <ul style="list-style-type: none"> <li>• <b>Ignore changes:</b> No action will be taken on change.</li> </ul>

## Sensor Settings

- **Trigger 'change' notification:** The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to [trigger a notification](#) <sup>1716</sup> whenever the sensor value changes.

## Sensor Display

### Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. **Note:** You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.

### Chart Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default):** Show an own graph for each channel.
- **Stack channels on top of each other:** Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. **Note:** This option cannot be used in combination with manual **Vertical Axis Scaling** (available in the [Sensor Channels Settings](#) <sup>1709</sup> settings).

### Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the [Root](#) <sup>224</sup> group's settings. To change a setting for this object, disable inheritance by clicking on the check mark symbol in front of the respective setting name. You will then see the options described below.

## Scanning Interval

### Scanning Interval

The scanning interval determines the time the sensor waits between two scans. Select a scanning interval (seconds, minutes, or hours) from the list. You can change the available intervals in the [system administration](#) <sup>1839</sup>.

**Schedules, Dependencies, and Maintenance Window**

**Note:** Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the <a href="#">account settings</a> <sup>1817</sup> . <b>Note:</b> Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Not set (monitor continuously):</b> No maintenance window will be set.</li> <li>▪ <b>Set up a one-time maintenance window:</b> Pause monitoring within a maintenance window.</li> </ul>
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: <ul style="list-style-type: none"> <li>▪ <b>Use parent:</b> Pause the current sensor if the device it is created on is in a <b>Down</b> status, or if it is paused by another dependency.</li> <li>▪ <b>Select object:</b> Pause the current sensor if the device it is created on is in an <b>Down</b> status, or if it is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a <b>Down</b> status, or if it is paused by another dependency. Select below.</li> </ul>

**Schedules, Dependencies, and Maintenance Window**

	<ul style="list-style-type: none"> <li>▪ <b>Master object for parent:</b> Make this sensor the master object for its parent device. The sensor will influence the behavior of the device it is created on: If the sensor is in a <b>Down</b> status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a <b>Down</b> status, or if it is paused by another dependency.</li> </ul> <p><b>Note:</b> Testing your dependencies is easy! Simply choose <b>Simulate Error Status</b> from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused.</p>
Dependency	<p>This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the <a href="#">object selector</a><sup>[159]</sup> to choose an object on which the current sensor will be dependent on.</p>
Delay (Seconds)	<p>Define a time span. After the master object for this dependency comes back to an <b>Up</b> status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value in seconds. <b>Note:</b> This setting is not available if you choose this sensor to be the <b>Master object for parent</b>. In this case, please define delays in the parent <a href="#">Device Settings</a><sup>[272]</sup> or the superior <a href="#">Group Settings</a><sup>[253]</sup>.</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its monitoring results.</li> <li>▪ <b>Write:</b> Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the <b>Revert children's access rights to inherited</b> option.</p> <p>For more details about access rights, please see section <a href="#">User Access Rights</a>.</p>
Channel Unit Configuration	
Channel Unit Types	<p>For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ <b>Bandwidth</b></li> <li>▪ <b>Memory</b></li> <li>▪ <b>Disk</b></li> <li>▪ <b>File</b></li> <li>▪ <b>Custom</b></li> </ul> <p><b>Note:</b> Custom channel types can be set on sensor level only.</p>

## Edit Sensor Channels

In order to change display settings, spike filter, and limits, please switch to the sensor's **Overview** tab and click on the gear icon of a specific channel. For detailed information, please see [Sensor Channels Settings](#)<sup>[1709]</sup> section.

## Notifications

Click on the **Notifications** tab to change notification triggers. For detailed information, please see [Sensor Notifications Settings](#)<sup>[1716]</sup> section.

## Others

For more general information about settings, please see [Object Settings](#)<sup>[142]</sup> section.

## 6.9 Additional Sensor Types (Custom Sensors)

Users can create and use their own, self-written custom sensors in PRTG Network Monitor to go far beyond PRTG's standard sensor set. You can create your own sensors using Windows Management Instrumentation Query Language (WQL), visual basic scripting, PowerShell, batch scripting, and by compiling an EXE or DLL file (using any Windows software development tool).

### Basics

For a general introduction, please see the sections about EXE/Script sensors and the API documentation which contains details about the necessary return format for those sensors. WMI Custom sensors allow executing WQL requests.

- [EXE/Script Sensor](#) 431
- [EXE/Script Advanced Sensor](#) 440
- [SSH Script Sensor](#) 1341
- [Application Programming Interface \(API\) Definition](#) 2031
- [WMI Custom Sensor](#) 1529

### Custom Sensors Included in PRTG

After installing PRTG Network Monitor you will already find a selection of custom EXE/Script and WMI WQL script sensors in the [PRTG program directory](#) 2074. Many of these are sample projects that you can edit and improve for your needs.

#### Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXE

- Demo Batchfile - Returns 200.bat
- Demo Batchfile - Set sensorstate to error.bat
- Demo Batchfile - Set sensorstate to warning.bat
- Demo Cmd - Returns 200.cmd
- Demo Dll - Returns a random integer.dll
- Demo EXE - Returns a random integer.exe
- Demo EXE - Returns number of files in folder (parameter).exe
- Demo EXE - Returns user of process.exe
- Demo Powershell Script - Available MB via WMI.ps 1
- Demo Powershell Script - InterruptsPerSec via WMI.ps 1
- Demo Powershell Script - Returns a fixed integer value.ps 1
- Demo Powershell Script - Returns a random integer value.ps 1
- Demo Powershell Script - Returns Random Integer and Warnings.ps 1

- Demo VBScript - InterruptsPerSec via WMI.vbs
- Demo VBScript - Multiplies two integers(2 parameters).vbs
- Demo VBScript - Returns a fixed float value.vbs
- Demo VBScript - Returns a fixed integer value.vbs
- Demo VBScript - Returns a random value.vbs
- Demo VBScript - Returns number of svchost processes.vbs
- Demo VBScript - Returns user of process.vbs
- Demo VBScript - Returns warning depending on number of svchost processes.vbs
- Demo VBScript - Timezone via WMI.vbs
- Demo VBScript - UTCTime via WMI.vbs
- Load\_Test\_CPU\_1\_Mio\_Primes.exe
- Load\_Test\_CPU\_10\_Mio\_Primes.exe
- Load\_Test\_Disk\_Write\_Read\_1000\_files.exe
- Load\_Test\_Disk\_Write\_Read\_10000\_files.exe
- Load\_Test\_Memory\_Allocate\_And\_Free\_400MB.exe

To create a new sensor based on one of these files, create a new [EXE/Script Sensor](#)<sup>431</sup> and choose the respective file from the drop down list.

### Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXEXML

- Demo Batchfile - Returns static values in four channels.bat

To create a new sensor based on one of these files, create a new [EXE/Script Advanced Sensor](#)<sup>440</sup> and choose the respective file from the drop down list.

### Custom Sensors Included in PRTG—Folder: \Custom Sensors\WMI WQL scripts

- Demo WQL Script - Get Win32LogicalDiscFreeMB.wql
- Demo WQL Script - Get Win32OsBuildnumber.wql
- Demo WQL Script - Get Win32PercentProcessorIdleTime.wql
- Demo WQL Script - Get Win32PercentProcessorTime.wql

To create a new sensor based on one of these files, create a new [WMI Custom Sensor](#)<sup>1529</sup> and choose the respective file from the drop down list.

### Downloading Pre-Build Custom Sensors

A good resource is the PRTG Add-Ons website on the open source platform [Google Code](#). There are also additional tools available.

Open Source Add-Ons for PRTG Network Monitor

- <http://code.google.com/p/prtg-addons/>

## More

For the other sensor types that work out-of-the-box, please see

- [List of Available Sensor Types](#) 

Knowledge Base: How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?

- <http://kb.paessler.com/en/topic/11283>

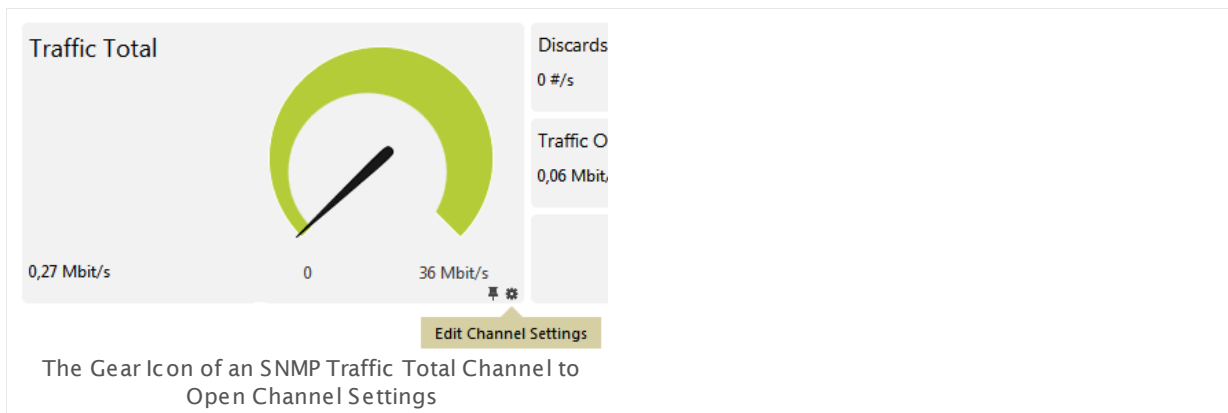

## 6.10 Sensor Channels Settings

A sensor has one or more channels in which it handles the actual monitoring data. In the channel settings you can define how the data from the sensor's different channels will be displayed in graphs, gauges, and tables. Additionally, the channel data can determine the sensor's status. Use the limit settings to achieve this.

On the sensor's **Overview** page, click on the gear icon of a specific channel gauge to change its settings. A click on the pin symbol on the left of the gear icon in a gauge will make this channel the primary channel of the selected sensor.

You can alternatively call the settings of a channel by clicking on the respective gear icon in the channels data table underneath the gauges.

**Note:** For [lookup](#) channels, we recommend staying below 120 lookup values to get expressive gauges. For non-primary lookup channels, the upper limit is around 40 lookup values.

The available options are nearly the same for all sensor types. An exception applies to the "Downtime" channel which is automatically calculated and does not offer all settings. Channels with "absolute" values additionally have an option for defining the **Value Mode**. You can quickly choose another channel of the selected sensor via the dropdown list on the top of the settings dialog.

Channel Settings for an SNMP Traffic Sensor

## Available Channel Settings

Edit Channel "[Name]"	
Name	Enter a meaningful name to identify the channel (not editable for script sensors after sensor creation). The name will be shown in graphs and tables. You can automatically add the sensor's ID to the name by using the placeholder <b>[#id]</b> .
Unit	This field is only visible for script sensors, the SNMP Custom sensor, and the SNMP Library sensor. Enter a string describing the unit of the returned values. This is for display purposes only. Please enter a string.

Edit Channel "[Name]"	
Value Lookup	This field is only visible for script sensors, the SNMP Custom sensor, and the SNMP Library sensor. Select the lookup list to be applied to this channel's settings.
ID	The ID of the channel cannot be changed; it is used for unique definition. For example, you need the ID when using <a href="#">Sensor Factory</a> <sup>856</sup> sensors.
Display	<p>Define where the channel will be displayed. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Show in Charts:</b> The data of this channel will be shown in sensor graphs. <b>Note:</b> If you hide a channel here, it will also be hidden if this graph is used in a <a href="#">Report</a> <sup>1775</sup>.</li> <li>▪ <b>Show in Tables:</b> The data of this channel will be shown in sensor data tables. <b>Note:</b> If you hide a channel here, it will not be considered for the calculation of the "sum" (total) channel of this sensor!</li> </ul> <p>To change this setting, remove or add the check mark symbol in front of it.</p>
Line Color	<p>Define in what color the channel will be displayed in graphs. You can choose between</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic</b></li> <li>▪ <b>Manual</b></li> </ul> <p>When you set this option to manual color definition please enter a color below.</p>
Color (#rrggbb)	This option is only available if <b>Manual</b> is selected in the <b>Line Color</b> setting above. Please either enter a color in hexadecimal RGB notation (as in HTML/CSS), or choose a color from the visual color selector. The field containing the hexadecimal color value will change to the resulting color immediately in both cases.
Data	<p>This setting is available for most channels. Define how data will be displayed. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Display actual values in [unit]:</b> Display the values in the unit shown.</li> <li>▪ <b>Display in percent of maximum:</b> Calculate and show percent values based on a maximum value. Provide a maximum below.</li> </ul>
Maximum ([unit])	This field is only visible if the percent of maximum setting is selected above. Enter a value that will be regarded as maximum. Please pay attention to the given unit. All percent values will be calculated based on this value. Please enter an integer value.

Edit Channel "[Name]"	
Line Width	Define in what color the channel will be displayed in graphs. Enter an integer value in pixels. Although the line width is not limited, we recommend using values between 1 and 7 only in order to achieve optimal results.
Value Mode	<p>This setting is only available for sensor channels which return <b>absolute</b> values. It is not available for sensors showing difference values, such as traffic sensors. Depending on this setting, the channel can not only show averages, but also minimum or maximum values in the graphs for the respective time spans. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Average:</b> The channel shows average values.</li> <li>▪ <b>Minimum:</b> The channel shows minimum values.</li> <li>▪ <b>Maximum:</b> The channel shows maximum values.</li> </ul> <p>See section More for more information.</p>
Decimal Places	<p>Define how many decimal places of the channel's data will be displayed in graphs and tables. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic:</b> Let PRTG choose how many decimal places will be used for optimal viewing results.</li> <li>▪ <b>All:</b> Force display of all available decimal places.</li> <li>▪ <b>Custom:</b> Manually define the number of decimal places. If you choose this option, an additional field will appear. Please enter an integer value there.</li> </ul>
Spike Filter	<p>A spike filter can be used to correct obviously faulty monitoring data. Sometimes, sensors report enormously high or far too low values; due to an error in data transmission, or due to incompatibilities of the physical device you are monitoring. This can make graphs unreadable. A spike filter can compensate for these flaws. When enabled values above and below a certain limit are disregarded in the monitoring data for graphs and tables. <b>Note:</b> The monitoring data itself will not be changed (but only the presentation of the data) and this setting is valid for all data of this channel (also the historic data). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable Filtering:</b> Display all data as it is; do not filter out spikes.</li> <li>▪ <b>Enable Filtering:</b> Enable a filter to remove spike values. Additional fields appear below.</li> </ul> <p><b>Note:</b> The spike filter option is not available for the channel <b>Downtime</b>.</p>

Edit Channel "[Name]"	
Spike Filter Max. Value [unit]	This field is only visible if spike filter is enabled above. Specify the maximum value allowed in the channel's data. All values above this value will be disregarded in graphs and tables. Please enter an integer value or leave the field empty.
Spike Filter Min. Value [unit]	This field is only visible if spike filter is enabled above. Specify the minimum value allowed in the channel's data. All values below this value will be disregarded in graphs and tables. Please enter an integer value or leave the field empty.
Vertical Axis Scaling	<p>Define how the vertical axis for the channel is displayed in graphs. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic Scaling:</b> Let PRTG decide on the optimum scaling; usually ranging from the minimum to the maximum value. PRTG will use one single scale for each unit label only.</li> <li>▪ <b>Manual Scaling:</b> Define the scaling manually. Additional fields appear below. Defining manual axis scaling can make low values better visible in your graph; but it may result in a chart with multiple vertical axis for the same unit label.</li> </ul> <p><b>Note:</b> Settings for this option are ignored if <b>Chart Type Stack channels on top of each other</b> or <b>Show in and out traffic as positive and negative area chart</b> (available for traffic sensors) is enabled in the sensor's <b>Settings</b> tab.</p>
Vertical Axis Maximum [unit]	This field is only visible if vertical axis scaling is enabled above. Specify the maximum value that will be used on the vertical axis for the channel. Enter an integer value.
Vertical Axis Minimum [unit]	This field is only visible if vertical axis scaling is enabled above. Specify the minimum value that will be used on the vertical axis for the channel. Enter an integer value.
Limits	<p>The channel can affect the status of the sensor it is part of. By entering limits, you can define when the sensor will enter a <b>Warning</b> or <b>Down</b> status; depending on the channel's data. Using this function, you can e.g. set a traffic sensor (which is usually never in a down state) to error when certain limits that you consider critical are reached.</p> <p>Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable Limits:</b> Do not use the channel's data to control the sensor's status.</li> <li>▪ <b>Enable Limits:</b> Define limits. Additional fields appear below. The sensor belonging to the channel will enter a <b>Warning</b> or <b>Down</b> status when limits are undercut or overrun.</li> </ul>

Edit Channel "[Name]"	
	<p><b>Note:</b> The limits option is not available for the channel "Downtime".</p> <p><b>Note:</b> If a channel uses <a href="#">lookups</a><sup>[2039]</sup>, we strongly recommend you to control the sensor status only via the lookup definition. If you define limits in addition here, the sensor will use both the channel limits and the status as defined in the lookup file. In this case, channel limits will determine the overall status of the sensor and overwrite the sensor message while the channel gauge still shows the status as defined in the lookups.</p>
Upper Error Limit [unit]	This field is only visible if limits are enabled above. Specify an upper limit for an error state. If the channel's values overrun this value, the sensor will be set to <b>Down</b> . <b>Note:</b> While a sensor shows a <a href="#">Down</a> <sup>[121]</sup> status triggered by a limit, it will still receive data in its channels. Please enter a decimal value or leave the field empty.
Upper Warning Limit [unit]	This field is only visible if limits are enabled above. Specify an upper limit for a warning state. If the channel's values overrun this value, the sensor will be set to <b>Warning</b> . Please enter a decimal value or leave the field empty.
Lower Warning Limit [unit]	This field is only visible if limits are enabled above. Specify a lower limit for a warning state. If the channel's values undercut this value, the sensor will be set to <b>Warning</b> . Please enter a decimal value or leave the field empty.
Lower Error Limit [unit]	This field is only visible if limits are enabled above. Specify a lower limit for an error state. If the channel's values undercut this value, the sensor will be set to <b>Down</b> . <b>Note:</b> While a sensor shows a <a href="#">Down</a> <sup>[121]</sup> status triggered by a limit, it will still receive data in its channels. Please enter a decimal value or leave the field empty.
Error Limit Message	This field is only visible if limits are enabled above. Enter an additional message. It will be added to the sensor's message when entering a <b>Down</b> status. Please enter a string or leave the field empty.
Warning Limit Message	This field is only visible if limits are enabled above. Enter an additional message. It will be added to the sensor's message when entering a <b>Warning</b> status. Please enter a string or leave the field empty.

Click on **Save** to store your settings or **Cancel** your changes.

## More

Knowledge Base: What is the Value Mode in channel settings?

- <http://kb.paessler.com/en/topic/60238>

## Sensor Settings Overview

For information about sensor settings, please see the following sections:

- [Sensor Settings](#)  290
- [List of Available Sensor Types](#)  291
- [Additional Sensor Types \(Custom Sensors\)](#)  1706
- [Sensor Channels Settings](#)  1709
- [Sensor Notifications Settings](#)  1716

## 6.11 Sensor Notifications Settings

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs.

The screenshot shows the PRTG Network Monitor web interface for the 'Sensor WMI Free Disk Space (Multi Disk) 4'. The 'Notifications' tab is selected, showing a configuration page for triggers. The page is divided into three main sections: 'TRIGGERS THAT CAN BE INHERITED FROM PARENT OBJECT(S)', 'TRIGGERS THAT ARE DEFINED IN LIBRARY OBJECT(S)', and 'OBJECT TRIGGERS'. The 'TRIGGERS THAT CAN BE INHERITED FROM PARENT OBJECT(S)' section shows a table with columns for 'Type', 'Notifications', and 'Inherited from'. The 'TRIGGERS THAT ARE DEFINED IN LIBRARY OBJECT(S)' section shows a table with columns for 'Type', 'Notifications', and 'Inherited from'. The 'OBJECT TRIGGERS' section shows a table with columns for 'Type', 'Notifications', and 'Actions'. The footer of the interface includes the PAESSLER logo, version information (PRTG Network Monitor 13.4.9.3728+ [Canary]), copyright (© 2013 Paessler AG), and contact information.

Example of Notification Trigger Settings

**Note:** Although the sensors activate a trigger, you can set notification triggers higher in the hierarchy (for example for groups or devices), thus defining triggers for multiple sensors using the [inheritance mechanism](#)<sup>[87]</sup>.

### Note

This section describes one of three steps to set up the notification system in PRTG. A complete notification setup involves:

1. Check and set up the **Notification Delivery** settings. This will tell PRTG how to send messages.  
For detailed information, see [System Administration—Notification Delivery](#)<sup>[1843]</sup>.
2. Check and set up several **Notifications**. This will define the kind of message and its content.  
For detailed information, see [Account Settings—Notifications](#)<sup>[1817]</sup>.
3. Check and set up **Notification Triggers** for objects. These will provoke the defined notifications.  
For detailed information, see [Sensor Notifications Settings](#)<sup>[1716]</sup>.

For background information, please see [Notifications](#)<sup>[1749]</sup> section.

## Available Notification Triggers Settings

On an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The available options are the same for all objects. When defining triggers for probes, groups, or devices, they can be inherited down to sensor level.

### Triggers that can be inherited from parent object(s)

You see a list of all notification triggers that are defined higher in the hierarchy. The list is empty when there are no triggers defined in groups or devices above the current object. You can see the type and the notifications that are executed once this trigger is activated.

#### Trigger Inheritance

Define whether the triggers shown above will be handed on to the current object. Choose between:

- **Inherit trigger(s) from parent object(s):** Use the triggers shown above.
- **Only use triggers defined for this object:** Do not use the triggers shown above; for this object only use the triggers defined below.

This setting is valid for all triggers shown above. It is not possible to only select some of them.

You can set up one or more of the following triggers, each with different setting options. Which trigger types will be visible depends on the kind of object you're editing:

- [Add State Trigger](#)  1717
- [Add Speed Trigger](#)  1719
- [Add Volume Trigger](#)  1721
- [Add Threshold Trigger](#)  1722
- [Add Change Trigger](#)  1724

All notification triggers can be created in a very easy way, forming natural sentences. There are different options for every type.

## Add State Trigger

Define a trigger that is activated when a sensor changes its current status. This is the most common reason to send out notifications. Click on the **Add State Trigger** button to add a new trigger, or click on the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more [notification\(s\)](#)  1817 to be executed.

State Trigger	
When sensor is...	<p>Select the condition that will trigger the notification. The trigger will be activated when a sensor enters the selected status. Choose from the drop down menu:</p> <ul style="list-style-type: none"> <li>▪ <b>Down:</b> The trigger will be prompted if a sensor changes to a <b>Down</b> status.</li> <li>▪ <b>Warning:</b> The trigger will be prompted if a sensor changes to a <b>Warning</b> status.</li> <li>▪ <b>Unusual:</b> The trigger will be prompted if a sensor changes to an <b>Unusual</b> status.</li> <li>▪ <b>Partial Down:</b> The trigger will be prompted if a sensor changes to a <b>Down (Partial)</b> status (available in a <a href="#">cluster</a><sup>1817</sup> configuration).</li> </ul>
...for at least ... seconds	<p>Define how many seconds will be waited before a notification is provoked. This can avoid false alarms in case a sensor 'flickers' and, for example, changes to a down status for just a few seconds. If the selected condition (i.e. the sensor status) persists after the defined time in seconds, the notification will be triggered. Please enter an integer value.</p>
...perform...	<p>Select a notification that will be triggered if the condition (i.e. the sensor status) selected is true <b>and</b> the latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a><sup>1817</sup> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.</p>
When condition continues for at least ... seconds	<p>Define an escalation latency in seconds. A second notification can be triggered if this number of seconds has passed since the sensor status has entered the defined condition. Use this to automatically escalate a notification in case a problem persists for a longer time. Please enter an integer value.</p>
...perform...	<p>Select a (second) notification that will be triggered if the condition (i.e. the sensor status) selected is true <b>and</b> the escalation latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a><sup>1817</sup> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.</p>
...and repeat every ... minutes	<p>Define an interval in minutes in which the escalation notification (defined above) will be sent repeatedly. The second (escalation) notification defined will be resent every x minutes. Please enter an integer value.</p>

State Trigger	
When condition clears perform...	Select a notification that will be triggered if the condition (i.e. the sensor status) selected is <b>not</b> true any more because the sensor's status has changed again. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.
Save	Click on the <b>Save</b> button to save your settings.
Delete	Click on the <b>Delete</b> button next to an existing notification trigger to delete it.

## Add Speed Trigger

Define a trigger that is activated when a sensor (for example, a traffic sensor) changes its current speed. Click on the **Add Speed Trigger** button to add a new trigger, or click on the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more [notification\(s\)](#) to be executed.

Speed Trigger	
When ... channel	From the drop down menu, select the channel which's data will be regarded for this comparison. Select <b>Primary</b> to generally use a sensor's primary channel (this can be defined in the <a href="#">sensor's settings</a> ) or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger will be based on the chosen channel.
...is...	<p>Select the condition that will trigger the notification. Choose from the drop down menu:</p> <ul style="list-style-type: none"> <li>▪ <b>Above:</b> The trigger will be prompted if the value of the selected channel overruns a defined value.</li> <li>▪ <b>Below:</b> The trigger will be prompted if the value of the selected channel undercuts a defined value.</li> <li>▪ <b>Equal To:</b> The trigger will be prompted if the value of the selected channel is the same as a defined value.</li> <li>▪ <b>Not Equal To:</b> The trigger will be prompted if the value of the selected channel is different than a defined value.</li> </ul>
[value]	Define the value the channel's data will be compared with. Please enter an integer value.

Speed Trigger	
[scale]	<p>From the drop down menu, select the unit in which you entered the [value] above. [scale] and [time] together define the unit for the given value. If the channel's data is shown in a different unit PRTG will automatically convert values internally. Choose between:</p> <ul style="list-style-type: none"> <li>▪ bit</li> <li>▪ kbit</li> <li>▪ mbit</li> <li>▪ gbit</li> <li>▪ tbit</li> <li>▪ Byte</li> <li>▪ KByte</li> <li>▪ MByte</li> <li>▪ GByte</li> <li>▪ TByte</li> </ul>
[time]	<p>Select the time for the scale (so you create a scale per time designation). Choose from the drop down menu:</p> <ul style="list-style-type: none"> <li>▪ second</li> <li>▪ minute</li> <li>▪ hour</li> <li>▪ day</li> </ul> <p>[scale] and [time] together define the unit for the given value. If the channel's data is shown in a different unit PRTG will automatically convert values internally.</p>
..for at least ... seconds	<p>Define how many seconds will be waited before a notification is provoked. This can avoid false alarms in case a channel reaches a limit for just a few moments. If the combined channel condition of [value], [scale], and [time] persists after the defined time span, the notification will be triggered. Please enter an integer value.</p>
...perform...	<p>Select a notification that will be triggered if the combined channel condition of [value], [scale], and [time] is true <b>and</b> the latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.</p>

Speed Trigger	
When condition clears perform...	Select a notification that will be triggered if the combined channel condition of <b>[value]</b> , <b>[scale]</b> , and <b>[time]</b> is <b>not</b> true any more because the channel's value has changed again. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a> <sup>1817</sup> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.
Save	Click on the <b>Save</b> button to save your settings.
Delete	Click on the <b>Delete</b> button next to an existing notification trigger to delete it.

**Note:** No escalation notification and no repeat are available for this trigger type.

## Add Volume Trigger

Define a trigger that is activated when a sensor (for example, a traffic sensor) reaches a certain volume limit in a specified time. Click on the **Add Volume Trigger** button to add a new trigger, or click on the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more [notification\(s\)](#) <sup>1817</sup> to be executed.

Volume Trigger	
When ... <b>channel</b>	From the drop down menu, select the channel which's data will be regarded for this comparison. Select <b>Primary</b> to generally use a sensor's primary channel (this can be defined in the <a href="#">sensor's settings</a> <sup>290</sup> ) or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger will be based on the chosen channel.
...has reached... <b>[value]</b>	Define the value the channel's data will be compared with. If the channel's data overruns this value, a notification will be triggered. Please enter an integer value.
<b>[scale]</b>	From the drop down menu, select the unit in which you entered the <b>[value]</b> above. <b>[scale]</b> and <b>[time]</b> together define the unit for the given value. If the channel's data is shown in a different unit PRTG will automatically convert values internally. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Byte</b></li> <li>▪ <b>KByte</b></li> <li>▪ <b>MByte</b></li> <li>▪ <b>GByte</b></li> </ul>

Volume Trigger	
	<ul style="list-style-type: none"> <li>▪ <b>TByte</b></li> </ul>
per [time]	<p>Select the time for the scale (so you create a scale per time designation). Choose from the drop down menu:</p> <ul style="list-style-type: none"> <li>▪ <b>Hour</b></li> <li>▪ <b>Day</b></li> <li>▪ <b>Week</b></li> <li>▪ <b>Month</b></li> </ul> <p>[scale] and [time] together define the unit for the given value. If the channel's data is shown in a different unit PRTG will automatically convert values internally.</p>
...perform...	<p>Select a notification that will be triggered if the [value] in the combined unit of [scale] and [time] is overrun. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a> <sup>1817</sup> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.</p>
Save	Click on the <b>Save</b> button to save your settings.
Delete	Click on the <b>Delete</b> button next to an existing notification trigger to delete it.

**Note:** No escalation notification, no repeat, and no notification when condition clears are available for this trigger type.

## Add Threshold Trigger

Define a trigger that is activated when a sensor reaches specific values. Click on the **Add Threshold Trigger** button to add a new trigger, or click on the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more [notification\(s\)](#) <sup>1817</sup> to be executed.

Threshold Trigger	
When ... <b>channel</b>	<p>From the drop down menu, select the channel which's data will be regarded for this comparison. Select <b>Primary</b> to generally use a sensor's primary channel (this can be defined in the <a href="#">sensor's settings</a> <sup>290</sup>) or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger will be based on the chosen channel.</p>

Threshold Trigger	
...is...	<p>Select the condition that will trigger the notification. Choose from the drop down menu:</p> <ul style="list-style-type: none"> <li>▪ <b>Above:</b> The trigger will be prompted if the value of the selected channel overruns a defined value.</li> <li>▪ <b>Below:</b> The trigger will be prompted if the value of the selected channel undercuts a defined value.</li> <li>▪ <b>Equal To:</b> The trigger will be prompted if the value of the selected channel is the same as a defined value.</li> <li>▪ <b>Not Equal To:</b> The trigger will be prompted if the value of the selected channel is different than a defined value.</li> </ul>
[value]	<p>Define the value the channel's data will be compared with. It will be directly compared to the channel's data. Please enter values in the smallest possible (base) unit, for example, in <b>bytes</b> or <b>seconds</b>. Please enter an integer value.</p>
..for at least ... seconds	<p>Define how many seconds will be waited before a notification is provoked. This can avoid false alarms in case a channel reaches a limit for just a few moments. If the defined channel condition persists after the defined time span, the notification will be triggered. Please enter an integer value.</p>
...perform...	<p>Select a notification that will be triggered if the defined channel condition is true <b>and</b> the latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a><sup>1817</sup> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.</p>
When condition clears perform...	<p>Select a notification that will be triggered if the defined channel condition is <b>not</b> true any more because the channel's value has changed again. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a><sup>1817</sup> settings. You can also choose <b>no notification</b> in order to only use other conditions for this trigger.</p>
Save	<p>Click on the <b>Save</b> button to save your settings.</p>
Delete	<p>Click on the <b>Delete</b> button next to an existing notification trigger to delete it.</p>

**Note:** No escalation notification and no repeat are available for this trigger type.

## Add Change Trigger

Define a trigger that is activated by an 'on change' trigger. Some sensors offer the option to send such a trigger whenever sensor values have changed. Click on the **Add Change Trigger** button to add a new trigger, or click on the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more [notification\(s\)](#)<sup>1817</sup> to be executed.

Change Trigger	
When sensor changes perform...	Select a notification that will be triggered whenever a compatible sensor sends a 'change notification'. You can enable this option in the <a href="#">settings</a> <sup>290</sup> of some sensors. The notification trigger will be activated immediately whenever a sensor sends an 'on change' trigger. Choose a notification from the drop down menu. The menu shows all notifications defined in the <a href="#">Account Settings—Notifications</a> <sup>1817</sup> settings.

**Note:** There are no other options available for this trigger type.

## Sensor Settings Overview

- [Sensor Channels Settings](#)<sup>1709</sup>
- [Sensor Notifications Settings](#)<sup>1716</sup>

## Object Settings Overview

For more general information about object settings, please see section [Object Settings](#)<sup>142</sup>.

# Part 7

## Ajax Web Interface—Advanced Procedures

## 7 Ajax Web Interface—Advanced Procedures

The Ajax-based web interface is your access to PRTG. It is used to configure devices and sensors, and to set up notifications, as well as to review monitoring results and to create reports. This web interface is highly interactive, uses Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While the user is [logged in](#)<sup>102</sup>, the data on the screen is permanently refreshed (via Ajax calls) so it always shows the current monitoring results (refresh interval and method can be [set](#)<sup>1856</sup> by the user).

Because the web interface works as a **Single Page Application (SPA)**, you will rarely see a full page refresh to avoid this performance impact due to redundant processing. Only single page elements will be refreshed when necessary. All object setting dialogs are shown as pop-up layers, so you will never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible.

The following sections introduce more advanced procedures in the Ajax Graphical User Interface (GUI).

## 7.1 Toplists

**Packet Sniffer** and **xFlow** (NetFlow, jFlow, sFlow, IPFIX) sensor types can not only measure the total bandwidth usage, they can also break down the traffic by IP address, port, protocol, and other parameters. The results are shown in so-called **Toplists**. This way PRTG is able to tell which IP address, connection, or protocol uses the most bandwidth. PRTG looks at all network packets (or streams) and collects the bandwidth information for all IPs, ports, and protocols. At the end of the toplist period, PRTG stores only the top entries of each list in its database.

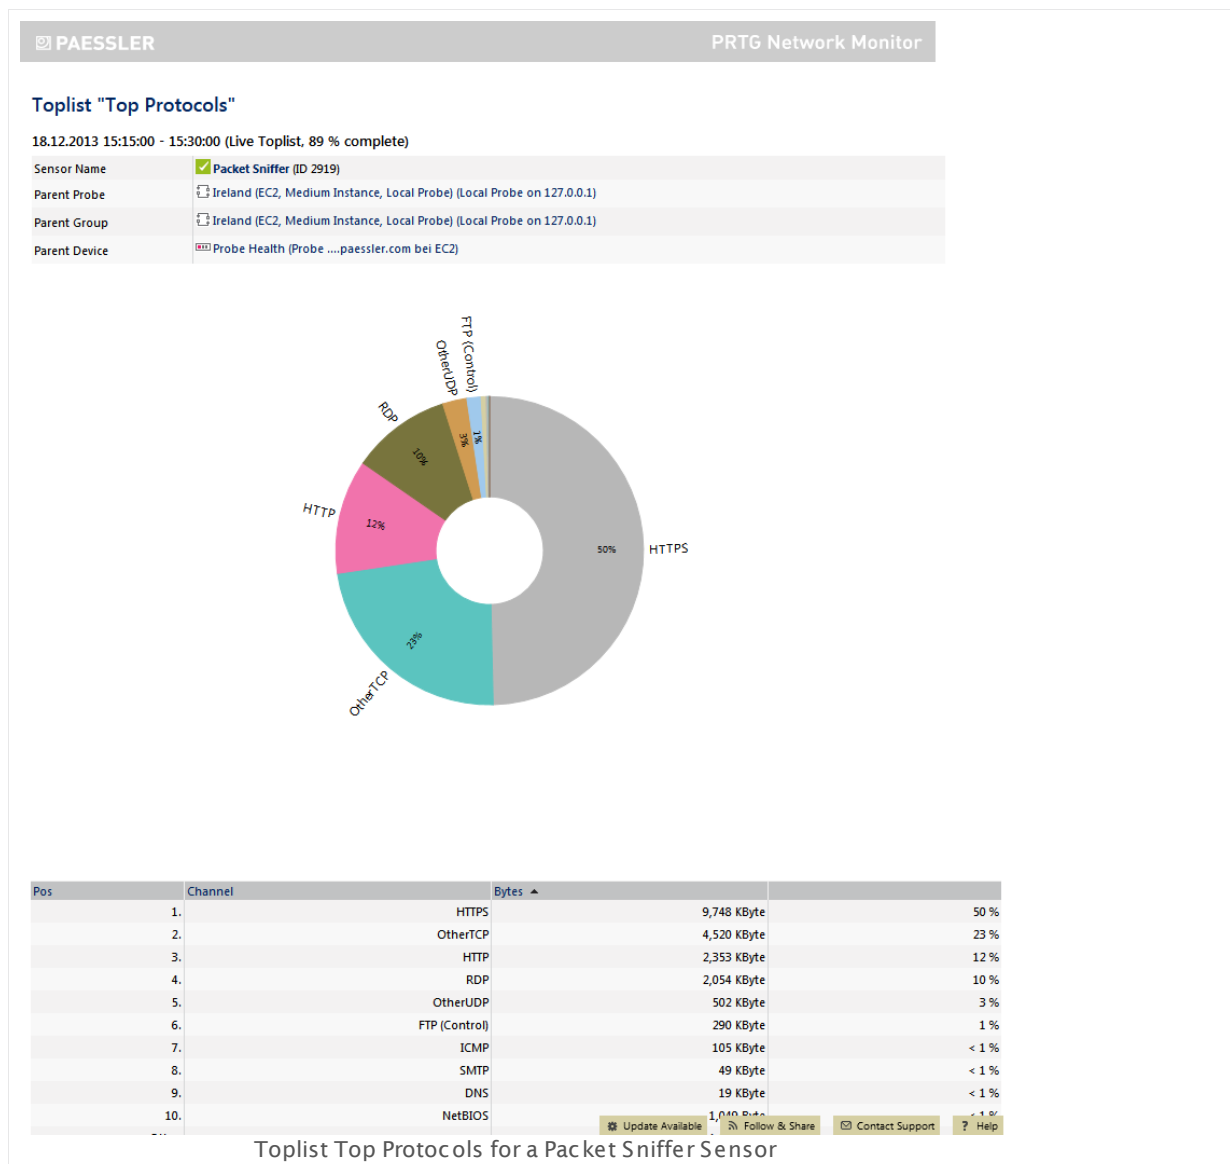

### Only Top Entries are Stored

Storing all available analysis data in a database during the analysis process would create a huge amount of data which would be very slow to transfer between probe and core and also retrieving data would be too slow. By storing only the top 100 entries for short periods of time it is possible to reduce the amount of data to a minimum while still being able to identify devices with huge bandwidth usage.

### Toplists Overview

**Toplists** are available for [xFlow, IPFIX, and Packet Sniffer sensors](#)<sup>[291]</sup> only. Toplist graphs are displayed right on the sensor overview page. By default, there are three different toplist predefined for each sensor:

- **Top Connections:** Shows bandwidth usage by connection.
- **Top Protocols:** Shows bandwidth usage by protocol.
- **Top Talkers:** Shows bandwidth usage by IP address.

Click on one of these items to view a distribution chart and a list of source and destination IP and port, protocols, kind of traffic in different channels, etc. It depends on the selected list which information is available. Click on an entry in the **Toplist Periods** lists on the left side to view data for a certain time span. By default, a time span of 15 minutes is set. Additionally, several [table list options](#) are available.

In order to print a toplist, click on the **Print this toplist** button to view a printer-friendly version and then use the print option of your browser to send it to your printer. With **Sensor Overview** you will return to the current sensor's overview tab. For a quick selection of other toplist of the current sensor, click on one of the toplist icons at the top of the page.

In the sensor overview, you can add or delete new toplist, or edit existing ones.

## Add

Click on the **Add Toplist** item in the sensor overview to create a new toplist. The available options are the same as for [editing](#) a list.

## Edit

Click on the small **gear icon** of a toplist item in the sensor overview to modify it.

Toplist Settings	
Name	Enter a meaningful name to identify the toplist.
Type	<ul style="list-style-type: none"> <li>▪ <b>Top Talkers (Which IPs use the most bandwidth?):</b> Shows bandwidth usage by IP address.</li> <li>▪ <b>Top Connections (Which connections use most bandwidth?):</b> Shows bandwidth usage by connection.</li> <li>▪ <b>Top Protocols (Which protocols use the most bandwidth?):</b> Shows bandwidth usage by protocol.</li> <li>▪ <b>Custom (Create your own toplist):</b> Create your own list by selecting criteria below.</li> </ul>
Toplist is based on	This setting is only available if a custom type is selected above. Select the fields you want to add to the toplist by adding a check mark in front of the respective field name. The available options depend on the type of sensor used. They're different for Packet Sniffer, NetFlow v5, v9 (and IPFIX), and sFlow. <b>Note:</b> For performance reasons, only select the field you really want to monitor. Please see <a href="#">Performance Considerations</a> section below.
Period (Minutes)	Define the interval for the toplist in minutes. Please enter an integer value. Toplists always cover a certain time span. Once a time span has passed, the top results are stored and a new toplist is started. <b>Note:</b> In order to avoid load problems on your probe system, please do not set this interval too long. Default setting is 15 minutes. Please see <a href="#">Performance Considerations</a> section below.
Top Count	Define the length of your toplist. Only this number of entries will be stored for each period. Please enter an integer value. <b>Note:</b> In order to avoid load problems on your probe system, please do not set this value as low as possible. Default setting is 100, in order to store the top 100 entries for each period. Please see <a href="#">Performance Considerations</a> section below.

Toplist Settings	
Probe/Core Data Transfer	<p>Define how the probe sends the toplist dataset to the core server. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>According to sensor interval (default):</b> Send data in the interval defined in the settings of the sensor this toplist is created for. This can create a lot of bandwidth and CPU load with many sniffer sensors, complex traffic, or long toplist.</li> <li>▪ <b>Wait until toplist period ends (less cpu&amp;bandwidth h usage):</b> Send data once a toplist period has finished. This will create less bandwidth usage and CPU load, but you cannot see the <b>current</b> toplist in the web interface, but only toplist with finished periods.</li> </ul> <p>For more information, please see <a href="#">Performance Considerations</a>  section below.</p>
Memory Limit (MB)	<p>Define the maximal amount of memory in MB the probe will use for collecting the different connection information. Every toplist adds its amount to the probe's memory consumption. Increase this value if the number of captured connections is not sufficient. Please enter an integer value.</p>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Delete

Click on the small **trashcan icon** of a toplist item in the sensor overview to delete it. Confirm with **Delete** to delete the list.

## Details

Click on the **windows symbol** to show details of a toplist.

## Performance Considerations

If you create toplist for data lines with considerable usage (for example, steady bandwidth over 10 Mbit/s) or if the traffic is very diverse (for example, many IPs/ports with only little traffic each) please consider the following aspects:

- The probe gathers all information needed for the toplist in RAM memory during each period. Only the top 100 entries are transferred to the core. Depending on the toplist type and traffic patterns the required memory can grow into many megabytes.
- Choose periods as short as desirable (especially important when traffic has a high level of diversity) to minimize memory usage.

- Memory requirements can grow almost exponentially with each field used in the toplist definition (depending on traffic pattern). Avoid complex toplist definitions for high and diverse traffic. For example, **Top Connections** (5 fields) needs a lot more memory than **Top Talkers** (1 field).
- If you experience high bandwidth usage between core and probe try to choose the **Wait until toplist period ends** option in the [toplist settings](#)<sup>1730</sup>.
- If you experience **Data incomplete, memory limit was exceeded** messages try to increase the memory limit in the toplist settings but keep an eye on the probe process' memory usage.

## Notes

- When working with toplist definitions be aware that privacy issues can come up for certain configurations of this feature. Using toplist definitions you can track all single connections of an individual PC to the outside world and you, as the administrator, must make sure that it is legal for you to configure PRTG like this.
- Keep in mind that toplist definitions can be viewed through the web interface. You may not want to show lists of domains used in your network to others. So you should restrict access to sensor types having toplist definitions.
- Note that diagrams, for example, for top connections are not meant to be used for detailed analysis. Rather they should indicate if there is an uncommon bigger change in this toplist.

- [Monitoring Bandwidth via Flows](#)<sup>1986</sup>
- [Monitoring Bandwidth via Packet Sniffing](#)<sup>1964</sup>

## 7.2 Arrange Objects

There are several possibilities to move objects within the device tree, or to move objects from one probe or group to another.

### Manage Tab in Device Tree

While viewing the device tree (or parts of it), click on the **Manage** tab to switch to a tree view in which you can move monitoring objects using drag&drop in your browser window. For more information, see section [Manage Device Tree](#)<sup>[222]</sup>.

### Device Details View: Arrange Sensors

When viewing the **Overview** tab of a device, you will see a list of all sensors on this device.

The screenshot shows the PRTG Network Monitor interface for the device 'Exchange Mail Server'. The 'Overview' tab is selected, showing a status bar with 'OK' and a list of sensors. A large gauge shows 'IMAP 1' status. Below, a table lists 14 sensors with columns for Position, Sensor Name, Status, Message, Graph, and Priority. To the right, a 'Geo Map' and three time-series graphs (2 days, 30 days, 365 days) are visible.

Pos	Sensor	Status	Message	Graph	Priority
1	PING 17	Up	OK	Ping Time 0 msec	★★★★★
2	WMI CPU Load 5	Up	OK	Total 36%	★★★★★
3	WMI Memory 5	Up	OK	Percent Available 50%	★★★★★
4	Intel(R) PRO 1000 MT Network Connection	Up	OK	Total < 0.01 Gb/s	★★★★★
5	MSExchange Store interface: RPC Requests failed_Total	Up	OK	RPC Requests fail 12,910	★★★★★
6	MSExchange Store interface: RPC Requests outstanding_Total	Up	OK	RPC Requests out 1	★★★★★
7	MSExchange Store interface: RPC Requests sent_Total	Up	OK	RPC Requests sent 111,800,410	★★★★★
8	MSExchange Store interface: RPC Slow requests_Total	Up	OK	RPC Slow requests 24,139	★★★★★
9	MSExchange Mailbox: Average Delivery Time_Total	Up	OK	Average Delivery 76,330 msec	★★★★★
10	MSExchangeS: RPC Averaged Latency	Up	OK	RPC Averaged Lat 3	★★★★★
11	MSExchangeS: RPC Operations/sec	Up	OK	RPC Operations/sec 222	★★★★★
12	MSExchangeS: RPC Requests	Up	OK	RPC Requests 0	★★★★★
13	MSExchangeS: RPC Averaged Latency	Up	OK	RPC Averaged Lat 2	★★★★★
14	MSExchangeS: Write Bytes RPC Clients/sec	Up	OK	Write Bytes RPC 401,771	★★★★★

Arrange Sensors on a Device

Click on the column headers **Pos**, **Sensors**, **Status**, or **Priority** to re-sort the sensor list. To change a sensor's position, simply click on the small grip at the beginning of the row, drag it to the position you like, and drop it. Changes take effect immediately.

### Context Menu: Move

You can also right-click on any object to show the [Context Menu](#)<sup>[163]</sup>. Select the **Move** entry to move sensors, devices, or groups up and down, or to move groups or devices into other groups or on other probes.

## 7.3 Clone Object

If you want to duplicate an object with the same settings, you can clone it. Cloning is available for groups, devices, and sensors. Unlike the results when using the [Create Device Template](#) <sup>1741</sup> option, a cloned device will contain all objects of the original device, regardless of whether they bring about working sensors or not (which often depends on the settings of the cloned device).

**Note:** You cannot clone 'fixed' objects, such as the root group or a probe device. You cannot clone the sensor types [QoS \(Quality of Service\) One Way Sensor](#) <sup>820</sup> and [QoS \(Quality of Service\) Round Trip Sensor](#) <sup>826</sup>.

**Note:** If you want to clone a **sensor**, a faster way will be to use the [Manage Device Tree](#) <sup>222</sup> function.

To start, right click on an object in your device tree, and from the [context menu](#) <sup>163</sup>, select **Clone...** An assistant will appear.

**Clone Sensor IMAP 1**

Duplicating Sensor by Cloning

To duplicate a sensor by creating a clone of a sensor you must choose a parent device and a new name for the sensor. Note: After creation the new sensor will be paused so you can edit its settings before monitoring is actually started.

**SENSOR TO BE CLONED**

Parent Probe: Local probe (Local Probe on 127.0.0.1)

Parent Group: Exchange

Parent Device: Exchange Mail Server

Sensor: IMAP 1

**NEW SENSOR NAME**

Choose a new name to describe the new sensor: Clone of IMAP 1

**PLEASE CHOOSE A DEVICE TO ADD THE NEW SENSOR TO**

Please select a device from the list

- Root
  - Local probe
    - Clone Staging
      - Clone\_Source
        - Baseline
          - BUexec
            - Google Search Appliance
    - Probe Device
      - Networking
        - Firewalls
          - Cisco ASA Primary
          - Cisco ASA FO/Test
        - Switches
          - HP 2810-24G - Workgroup
          - GigabitSwitch Server
          - 3Com 2928 - Wireless/POE
          - Core Switch
      - Virtual Hosting
        - XenServer

Continue > Cancel

Clone Dialog for a Sensor

## Clone Object Settings

### Object To Be Cloned

#### Object

Several fields show information about the object that is to be cloned. The available information varies depending on whether you are about to clone a group, device, or sensor.

### New Object Name

#### New Object Name

Enter a name for the cloned object. By default, the old name is filled in, preceded by **Clone of**.

#### New IP Address/DNS Name

This field is only available when cloning a device. Enter the IP address or DNS name for the new device.

### Please choose a group/device to add the new object to

From the device tree shown, choose an object you want to add the cloned object to. When cloning a group or device, select a group. When cloning a sensor, select the device you want to add it to.

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

You will be redirected to the newly cloned object's [overview](#)<sup>[124]</sup> page. By default, all sensors are initially paused to give you the chance to change settings before monitoring starts. Please check the [settings](#)<sup>[142]</sup> and [resume](#)<sup>[162]</sup> monitoring.

## Related Topics

- [Create Device Template](#)<sup>[1741]</sup>
- [Manage Device Tree](#)<sup>[222]</sup>

## 7.4 Multi-Edit

Device and sensor table lists, as well as some other lists, offer multi-edit functionality. With this, you can bulk edit the properties of many objects at a time. Multi-edit is also available in the **Management** tab if you select multiple objects by holding down the **Ctrl** key (see [Manage Device Tree](#) <sup>223</sup>).

**Note:** Using multi-edit, not all settings can be changed. PRTG will offer only settings which all selected objects have in common.

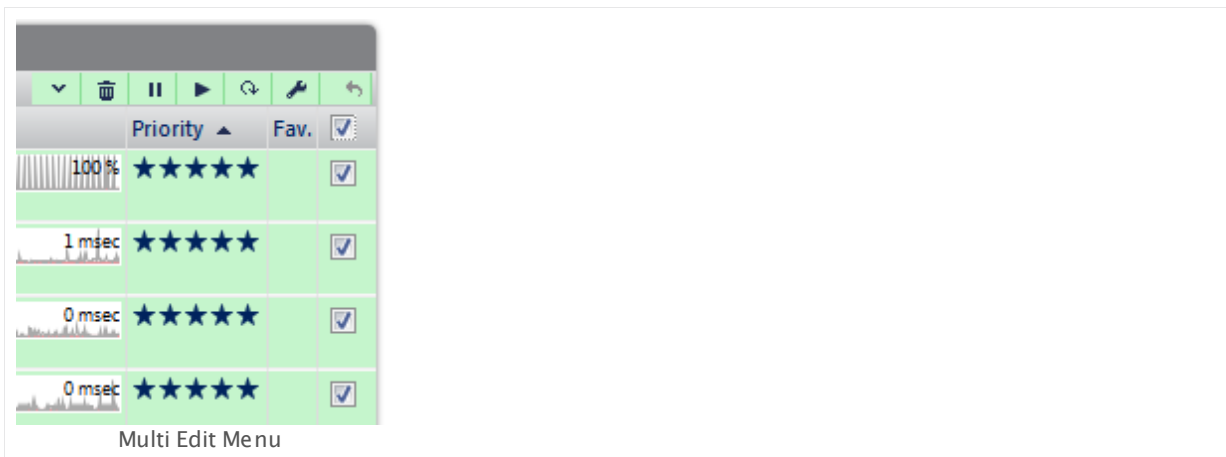

**Note:** The multi-edit option is not available for the standard [user groups](#) <sup>1861</sup> PRTG Administrators and PRTG Users Group.

Example of a Table List

### Start Multi-Edit in Lists

Start with viewing a table list. For example, choose **Sensors | By Type | ...** or **Devices | Device List | ...** from the main menu. Table lists are also available in the **Overview** tab of [Libraries](#) <sup>1759</sup>, [Maps](#) <sup>1794</sup>, [Reports](#) <sup>1775</sup>, [Notifications](#) <sup>1749</sup>, and [Schedules](#) <sup>1827</sup>.

In a table list, start multi-edit by selecting objects using the check boxes on the right. You can also select all objects of the current page at once by clicking the check box in the table header. Use the **Item Count** option to view more items per page. As soon as you select one or more objects, the multi-edit menu will appear at the top of the table and chosen objects are shaded in green.

Depending on the object type, different functions are available. For example, for sensor lists, some frequently used functions are available as quick buttons, such as **Delete**, **Pause**, **Resume**, **Check Now**, and **Settings**. If you click on one of those buttons, the respective function will be applied to all selected objects.

Other options are available in the drop down menu. **Hover** the arrow symbol to show it.

The options in this menu vary depending on the kind of objects selected. If you choose an entry, the respective function will be applied to all selected objects.

Once you have selected the objects you want to change settings for, click on the screwdriver symbol to enter the edit settings mode. For available settings, please see below.

## Start Multi-Edit in Management Tab

In the device tree, start by clicking the **Management** tab.

You can use Multi-Edit for object settings:

- Hold down the **Ctrl** key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you would like to edit, change the according values and click on **Save**. The changes will be applied to all selected objects.

For available settings, please see below.

## Edit Settings—Settings

In the multi-selected sensors' **Settings** tab within the **Edit Multiple Objects** popup, you can edit most of the sensors' properties which they have in common, respectively in the **Edit Multiple Objects** popup for devices. For example, for devices or sensors, edit the name, tags, priority, scanning interval, access rights, etc.

**Editing 3 Objects**

**Edit Multiple Objects**

This page allows to edit one or more settings for a selection of objects (groups, devices, sensors, etc.). First enable the checkbox in the first column for each setting that you want to change for all selected objects. Then enter/select your new value.

You are editing 3 objects ([Show all objects](#)):

**BASIC DEVICE SETTINGS**

☐ Device Name

☐ Status  
☒ Started  
☐ Paused

☐ IP Version  
☒ IPv4 device  
☐ IPv6 device

☐ IPv4 Address/DNS Name

☐ IPv6 Address/DNS Name

☐ Tags

☐ Priority  
 ★★★★★

**ADDITIONAL DEVICE INFORMATION**

☐ Device Icon

OK Cancel

Example of Device Settings in Multi-Edit Mode

The available options depend on the selected objects and will vary according to your selection. When editing multiple sensors, it may be useful to only choose one certain sensor type from the list, so that there are as much settings as possible available for multi-edit.

In order to change a property, add a check mark in front of the respective line and then change the settings. The new setting(s) will be applied to all objects you selected for multi-edit. All properties that are not activated with a check mark will remain unchanged.

Click on the **OK** button to store your settings. If you close the popup via the **X** or **Cancel** button, all changes to the settings will be lost!

## Edit Settings—Channel Settings

The **Channel Settings** tab in the **Edit Multiple Objects** popup is only available when editing sensors. You can edit settings of all channels which the selected sensors have in common. Select a channel name from the **Channel** list. You can then edit, for example, channel name, ID, display settings, colors, scaling, limits, etc.

Example of Sensor Channel Settings in Multi-Edit Mode

The available options depend on the selected sensors and will vary according to your selection. It may be useful to only choose one certain sensor type from the list, so that there are as much channel settings as possible available for multi-edit.

In order to change a property, add a check mark in front of the respective line and then change the channel settings. The new setting(s) will be applied to all sensors you selected for multi-edit. All properties that are not activated with a check mark will remain unchanged.

Click on the **OK** button to store your settings. If you close the popup via the **X** or **Cancel** button, all changes to the settings will be lost!

## Related Topics

- [Working with Table Lists](#) <sup>156</sup>

- [Manage Device Tree](#) 

## 7.5 Create Device Template

If you want to add a certain device several times, you can create a device template from an existing device in your device tree. When creating a device template, information for nearly all sensors on this device will be saved to a template file which you can later use in combination with [Auto-Discovery](#)<sup>[190]</sup> (restrictions apply for a few sensor types). From the sensors, all relevant settings will be saved, except those that refer to other objects, such as schedules, triggers, access rights, etc. They will automatically be reverted to **Inherit**.

To start, right click on a device in your device tree, and from the [context menu](#)<sup>[163]</sup>, select **Create Device Template....** An assistant will appear.

**Create Device Template for Cisco ASA Primary**

**Creating Device Templates**

To create a template that can be used for auto-discovery you have to provide a file name, as well as a clear text name which will be used in the appropriate select box for device templates. The template will contain an entry for every sensor of the selected device applicable for autodiscovery. That entry contains all relevant sensor settings except settings which refer to other objects (schedules, triggers, access rights, etc.). These settings will revert to 'inherited' when a sensor is created via a template.

**CHOOSE TEMPLATE NAME**

Choose a name which is used to store the template in the 'devicetemplate' folder of your PRTG installation. You can omit the file extension, it will be .odt anyway

File Name **MyTemplateFile**

Enter a clear name for display purposes

Template Name **My Device Template Name**

**Continue >** **Cancel**

Create Device Template Assistant

### Device Template Settings

#### File name for the template

File Name	Enter a name under which the file will be stored. It will be stored with the extension <b>.odt</b> in the <b>\PRTG Network Monitor\devicetemplates</b> sub-directory of your PRTG core installation (of the Master node, if in a cluster). The file may not exist in this directory, otherwise you will see an error message.
Template Name	Enter a meaningful display name for the template, as it will appear in the web interface.

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

You should see a success message indicating that your template file was saved. Finished! The device template is now stored in the program path of your PRTG core installation. Your device template file contains all sensors, including their settings, of the original device.

During your next auto-discovery, choose the **Automatic sensor creation using specific device template(s)** option and select the name of your newly created device template from the list. PRTG will then try to discover the stored sensor types on the new (or existing) device. If the physical device answers to a sensor request, the sensor is added to the PRTG device.

**Note:** Numbers will be added to the original sensor names. For detailed information, please see [Auto-Discovery](#) <sup>190</sup> section.

## Settings That Are Not Saved

There are a few settings which cannot be saved into a device template, and will therefore be set to default, such as the **Dependency Type** setting **Master object for parent** (in **Schedules and Dependencies** section), and **Result Handling** settings **Write result do disk** (as this is intended for debugging purposes only). Also, settings in the **Access Rights** section are not saved to avoid security flaws.

Furthermore, due to internal restrictions, the following sensor types will not be saved into a device template:

- Amazon CloudWatch
- Core/Probe/Cluster Health
- DHCP
- Enterprise Virtual Array
- IPFIX
- IPFIX (Custom)
- IPMI System Health
- jFlow V5
- jFlow V5 (Custom)
- NetFlow V5
- NetFlow V5 (Custom)
- NetFlow V9
- NetFlow V9 (Custom)
- Packet Sniffer
- Packet Sniffer (Custom)
- Passive Application Performance
- QoS (Quality of Service)

- QoS (Quality of Service) Roundtrip
- Sensor Factory
- sFlow
- sFlow (Custom)
- SNMP Trap Receiver
- Syslog Receiver
- WMI Security Center
- WMI Volume (use [WMI Free Disk Space \(Multi Drive\) Sensor](#)<sup>1573</sup> instead)

## No Update of Device Templates

Once a device template is created, it is not possible to add additional sensors to it. If you want to create a template with an extended set of sensors, please create a new one. **Note:** When saving a new device template, all internal IDs of the sensors contained in this template are updated. Therefore, when applying a new template to an existing device, all sensors contained in this template will be newly created on this device, even if those sensors were previously created using (another) device template!

## 7.6 Geo Maps

With the PRTG Geo Maps feature you can visualize geographical information about your monitored objects. You can display the location of **probes**, **groups**, and **devices** in a graphical map on an object's details page, or on PRTG [Maps](#)<sup>1794</sup>. This feature is especially useful when you monitor networks which are spread over different locations, for example, in various cities of a country or all over the globe.

For each probe, group, or device, you can enter **Location** information. PRTG will use the first line of this information to query a geographical map which shows your objects. Your location specification will be resolved to global geographical coordinates by the PRTG core server with the help of an external map service provider.

PRTG will connect to the specified maps provider to get **map tiles**. These are used to set up the graphical map. Then the defined locations will be marked with the corresponding object icons and their **status**<sup>1747</sup> on the map. You can select your favorite map tiles provider in [System Administration—User Interface](#)<sup>1832</sup> (setting **Geo Maps**).

Geographical maps can be displayed on the device tree. PRTG will adjust the zoom of a map automatically such that all locations of a selected object can be displayed. You can also add geographical maps to PRTG [Maps](#)<sup>1794</sup>. For this concern, go to the PRTG [Maps Designer](#)<sup>1800</sup> (either in an existing map or creating a new one) and choose the entry **Geo Maps** from the properties menu on the right.

## Using Geo Maps

In order to use geographical maps within the PRTG [web interface](#)<sup>[100]</sup> or [Enterprise Console](#)<sup>[1894]</sup>, please make sure the following:

1. In the system administration (within the web interface), select the maps provider and type you want to view. There, you will also find an option to disable geo maps integration if you do not want to use it. See section [System Administration—User Interface](#)<sup>[1832]</sup> (setting **Geo Maps**) for detailed information.
2. In your [objects' settings](#)<sup>[142]</sup>, add a city name, or address, or coordinates in the first line of the **Location** field. As soon as you view the details of such an object, a geographical map will be shown. The **Location** information will also be used when viewing objects in the [Enterprise Console](#)<sup>[1894]</sup> or when adding **Geo Maps** objects to PRTG [Maps](#)<sup>[1794]</sup>.
3. Make sure your PRTG core server has access to the internet in order to obtain map tiles. If a proxy is mandatory in your network, please configure proxy settings accordingly. For details, please see [System Administration—Core & Probes](#)<sup>[1849]</sup>. For details about tile server domains, please see [More](#)<sup>[1748]</sup> section below.

## Labeling Locations

You can define your own labels for locations of objects. For this concern, enter the desired label in the first line of the **Location** settings and provide the geo coordinates of the location in the second line. In PRTG's geo map, this object will be displayed with the defined label.

**LOCATION**

☐ Inherit from  Microsoft Servers (Location (for geo maps): Bucher Str. 79a, Nür...)

Location (for geo maps)

Big Apple  
40.712778, -74.005833

Defining Location New York City with Geo Coordinates and Label  
Big Apple

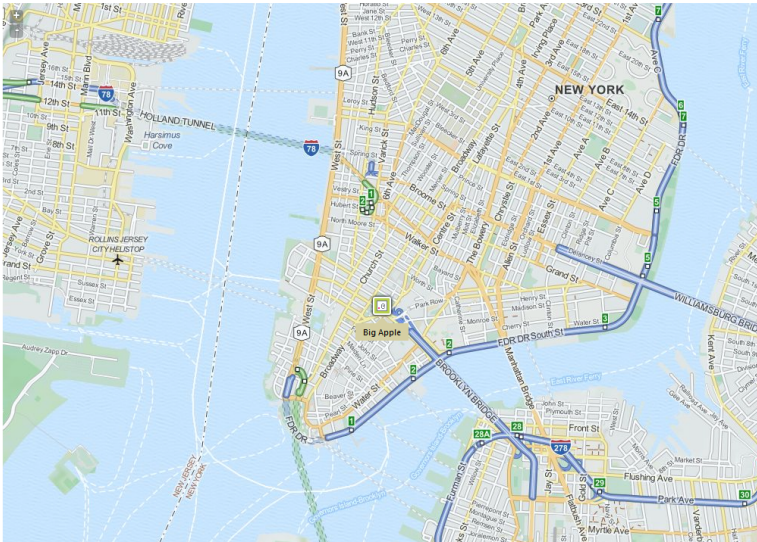

The location New York City will appear with the label Big Apple then:

Home Devices Libraries Sensors Alarms Maps Reports Logs Tickets Setup

Devices Local probe Microsoft Servers Exchange

New Alarms 1 New Log Entries 163 45 12 422 36 34

**Geo Map for Exchange**

Location New York City with Label Big Apple

It is also possible to define the same label for different locations. For example, imagine your company's headquarter is spread over several different locations. For each object representing a dedicated headquarter in the PRTG device tree, enter its coordinates in the second line of the respective **Location** settings and the label "Headquarter" in the first line. All corresponding objects will be displayed as "Headquarter". This way, you can easily find your desired objects on the map.

## Map Icon Colors

On the geographical maps the different location icons will show the overall status at this location by using a color code. Following, all possible location states are listed ordered by their hierarchy:

Flag	Flag Color	Location Status	Meaning
	Red	<b>Down</b>	At least one sensor at this location shows a red <b>Down</b> status. Hover the circle with the letter symbol in the legend to view the total number of alarms at this location.
	Bright-Red	<b>Down (Acknowledged)</b>	At least one sensor at this location is <b>Down</b> and the status was acknowledged by a PRTG user, applying the <b>Acknowledge Alarm</b> function. The <b>Down</b> states of all sensors at this location have to be acknowledged—if at least one sensor is unacknowledged down, this location will be displayed as <b>Down</b> .
	Yellow	<b>Warning</b>	At least one sensor at this location shows a yellow <b>Warning</b> status. There is no sensor in a <b>Down</b> or <b>Down (Acknowledged)</b> status at this location.
	Orange	<b>Unusual</b>	At least one sensor at this location shows an orange <b>Unusual</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , or <b>Warning</b> status at this location.
	Green	<b>Up</b>	All sensors at this location are in a green <b>Up</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , <b>Warning</b> , <b>Paused</b> , or <b>Unusual</b> status at this location.
	Blue	<b>Paused</b>	All sensors at this location show a blue <b>Paused</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , <b>Warning</b> , <b>Unusual</b> , or <b>Up</b> status at this location.
	Black (Grey)	<b>Unknown</b>	All sensors at this location have an <b>Unknown</b> status. There is no sensor in a <b>Down</b> , <b>Down (Acknowledged)</b> , <b>Warning</b> , <b>Unusual</b> , <b>Paused</b> , or <b>Up</b> status at this location.

**Note:** For detailed information about sensor states, please see [Sensor States](#)<sup>[121]</sup> section.

## Geo Tracking of Your Mobile Device

It is possible to show the location of an Android device and track its movements on PRTG Geo Maps. PRTG can draw the route a device has taken directly into geo maps. For this feature, you need the **PRTG Mobile Probe for Android**. See section [More](#)<sup>1748</sup> for details.

## 7.7 Notifications

Notifications are used to send alerts to the user whenever PRTG discovers a defined status, such as slow or failing sensors, or when threshold values are breached. You can define an unlimited number of notifications allowing to use one, or more, of several communication channels like email, text messaging, and many more. For video instructions, please see the [More](#)  section below.

### Overview

Notifications can be triggered by:

- **Sensor status changes**  
For example, when a sensor changes status to **Up** or **Down**, if responses are slow, or sensors show an **Unusual** status.
- **Sensor value threshold breaches**  
For example, when a sensor shows a request time higher than 1,000 ms for more than 30 minutes.
- **Speed threshold breaches**  
For example, when a traffic sensor shows more than 1 Mbit/s for more than 5 minutes.
- **Volume threshold breaches**  
For example, when a traffic sensor shows more than 1 Gbyte transferred in 24 hours.
- **Sensor value changes**  
For some sensors you can trigger a notification whenever the value changes, for example, when monitoring files on a hard disk drive.

A notification can be one of these actions:

- **Send Email**
- **Add Entry to Event Log**
- **Send Syslog Message**
- **Send SNMP Trap**
- **Send SMS/Pager Message**
- **Execute HTTP Action**
- **Execute Program**
- **Send Amazon Simple Notification Service (SNS) Message**
- **Assign Ticket**

For details, see section [Account Settings—Notifications](#) .

**Note:** Usually there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost.

Notifications can contain valuable sensor information, such as:

- Last error message
- Last good/failed request
- Total downtime
- Total uptime
- Recent sensor history
- A direct link to the web interface

## Notifications Setup

There are three steps to take in order to use notifications with PRTG. Please go through all of them:

1. Check and set up the **Notification Delivery** settings. This will tell PRTG how to send messages.  
For detailed information, see [System Administration—Notification Delivery](#)  1843.
2. Check and set up several **Notifications**. This will define the kind of message and its content.  
For detailed information, see [Account Settings—Notifications](#)  1817.
3. Check and set up **Notification Triggers** for objects. These will provoke the defined notifications.  
For detailed information, see [Sensor Notifications Settings](#)  1716.

See section [Setting Up Notifications Based on Sensor Limits: Example](#)  1751 for a step-by-step guide describing a potential notifications setup.

## 7.7.1 Setting Up Notifications Based on Sensor Limits: Example

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

This section will show you exemplarily how to set up a notification for exceeded disk free limits. The approach for this specific use case is examined step by step. You can easily adapt it to declare limits for other sensor types.

There are several steps to take in order to set up notifications based on limits:

- [Step 1:](#)  Provide necessary information about the delivery of notifications (SMTP and SMS).
- [Step 2:](#)  Create notifications, specifying the type of notification and its content.
- [Step 3:](#)  Define thresholds that will change a sensor's status (this is not necessary for every kind of notification).
- [Step 4:](#)  Add suitable triggers to objects which will evoke notifications if something is going wrong in your network.
- [Step 5:](#)  Test if the created notification will be triggered and delivered correctly.

**Note:** When you set up your own notifications, you will not necessarily need to go through all the steps described here. In this section, our main goal is to give you a general idea of the notifications concept.

### Step 1: Setting up the Notification Delivery

Before creating notifications, you first have to define how those notifications actually will be delivered to your email account, mobile phone, or pager. To do so, choose **Setup | System Administration | Notification Delivery** from PRTG's main menu bar. Specify the mechanism of SMTP delivery, sender email and name, as well as the HELO ident. For SMS delivery, select your service provider and provide the corresponding credentials. You can find details about notification delivery in section [System Administration—Notification Delivery](#) .

### Step 2: Setting up the Notification's Content

In order to get an informative message when a disk is running out of capacity, create a corresponding notification. Choose **Setup | Account Settings | Notifications** from PRTG's main menu bar and click on the button **Add New Notification**. Give the notification an explanatory name; in our case you could use **Disk Free Limit Notification**. However, if you want to trigger this notification on a global level (for example, for a probe or group) such that it would not only apply to breached disk free limits, a general name would be more suitable (like the predefined notification "Email to Admin"). If you leave the default text of the newly created notification, it will already contain all necessary information, like:

- which sensor is affected,
- since when the sensor is affected,
- last value of this sensor,

## Part 7: Ajax Web Interface—Advanced Procedures | 7 Notifications

## 1 Setting Up Notifications Based on Sensor Limits: Example

- etc.

See section [More](#)<sup>1757</sup> for the other options you have here.

After providing this basic information, select the delivery method. In our case, we choose **Send Email** for this notification by marking the corresponding checkbox. Specify who will receive the notification, its subject, the format, the content of the email, and its priority. By default, the email notification will contain several information parameters about the evoking sensor: its name, status, time, message, location in the device tree, etc. Feel free to adjust email messages to your needs (see section [More](#)<sup>1757</sup>). You can choose any other notification method, of course (see [Account Settings—Notifications](#)<sup>1820</sup>).

Save Cancel

Creating an Email Notification

Once the notification is set up completely, click on **Save**. You will be redirected to the notifications overview page. You can now use this notification for every trigger on every object in your device tree.

### Step 3: Define Limits

Before creating triggers that evoke notifications, first specify the limits which you want to apply to your disks. For example, if you want to be notified when a disk has exceeded 80% of its capacity, force the sensor into a **Warning** status at this utilization. You have several options to set limits for disk free sensors:

- Set limits checked against all disks in the settings of multi-drive sensors: [WMI Free Disk Space](#)<sup>1573</sup>, [SNMP Linux Disk Free](#)<sup>1122</sup>, [SSH Disk Free](#)<sup>1286</sup>
- Enable limits in Channel settings of single sensors
- You can achieve both with [Multi-Edit](#)<sup>1738</sup>

### Step 3.1: Define Limits in Sensor Settings (Multi-Disk Free Sensors Only)

You can set limits for sensors monitoring multiple disks directly via the **Settings** tab on a sensor's details page. [Multi-Edit](#)<sup>1738</sup> for existing sensors is also possible. Open the settings of the selected sensor(s) and go to section **Set limits checked against ALL disks**. There, for example, enable **Percentage Limit Check**. In the field **Lower Warning Limit**, enter the percentage suitable to your needs. In our example, this would be **20**. Alternatively, you can use bytes to define a limit. However, we recommend using percentage values for more flexibility. This limit will apply to all channels of this sensor representing disks.

#### SET LIMITS CHECKED AGAINST ALL DISKS

Please use the channel tab to set separate error/warning limits for each disk

Percentage Limit Check	<input type="radio"/> Disable Percentage Limits <input checked="" type="radio"/> Enable Percentage Limits
Upper Error Limit	
Upper Warning Limit	
Lower Warning Limit	20
Lower Error Limit	10
Byte Limit Check	<input checked="" type="radio"/> Disable Byte Limits <input type="radio"/> Enable Byte Limits
Alarm on Missing/Removed Disk	<input checked="" type="radio"/> Deactivate Alarm (default) <input type="radio"/> Activate Alarm

#### SENSOR DISPLAY

Primary Channel	Free Space C: (%) ▼
Chart Type	<input checked="" type="radio"/> Show channels independently (default) <input type="radio"/> Stack channels on top of each other

Setting Limits for All Disks

**Note:** This sensor setting is only available for multi-drive sensors. You can omit Step 3.1 for all sensors that are not from the type "disk free".

### Step 3.2: Define Limits for Sensor Channels

In order to set specific limits for single disks, use the sensor's **Channel** settings. You can open channel settings via the gear icon in the respective channel gauge or in the channels table.

**Enable Limits** at the bottom of the channel settings dialog and specify your desired limits in the **Lower Warning Limit** field. This limit will only apply to the respective channel.

**Note:** If you define channel limits when using the sensor's limit setting in the sensor's **Settings** tab at the same time, the first limit that applies will be considered. This way, you can individually define harder limits for single disks in a multi-disk sensor. All defined limits are valid side-by-side.

You **have** to take the approach via channel settings for sensor types that monitor only one (logical) disk, for example, the [SNMP Disk Free Sensor](#)<sup>1020</sup>. For these sensor types, you can use [Multi-Edit](#)<sup>1739</sup> if you want to apply the same limits for each of these sensors automatically.

- To see all sensors of this type at a glance, just filter for it: From PRTG's main menu bar, choose **Sensors | By Type | SNMP Disk Free**.
- Mark the checkboxes of the sensors you want to add a limit for.
- Click the screwdriver symbol in the multi-edit bar.
- Open the **Channel Settings** tab.
- Select the channel you want to add a limit for; in this case it would be most likely the channel **Free Space**.
- Then **Enable Limits** at the bottom of the dialog and enter the number in the correct field as described above.

Once done, save these settings—the new limit will apply to all channels with this name of the multi-edited sensors.

## Part 7: Ajax Web Interface—Advanced Procedures | 7 Notifications

### 1 Setting Up Notifications Based on Sensor Limits: Example

Editing 17 Objects

Edit Multiple Objects

This page allows to edit one or more settings for a selection of objects (groups, devices, sensors, etc.). First enable the checkbox in the first column for each setting that you want to change for all selected objects. Then enter/select your new value.

You are editing 17 objects (Show all objects):

Setting Limits for Channels with Multi-Edit

#### Step 4: Setting up the Notification Trigger

You have specified limits to define when a sensor will go into a **Warning** (or **Error**) status. Now you can create the according triggers. The trigger we use in this example is the **State Trigger**. For details about other possible notification triggers, see section [More](#)<sup>1757</sup>.

- You can set up a **State Trigger** on any level in your device tree. For example, open a group containing the device(s) representing your disks.
- Go on the **Notifications** tab.

## Part 7: Ajax Web Interface—Advanced Procedures | 7 Notifications

## 1 Setting Up Notifications Based on Sensor Limits: Example

- Click **Add State Trigger**.
- Set the trigger to **"When sensor is Warning"** and choose the notification you have created before (**"Disk Free Limit Notification"** or a more general one) from the drop down list.
- Adjust the other notification settings to your needs and save this new object trigger.

Now you will be notified immediately when the capacity of one of your disks falls below the defined limit, in this case 20% free disk space.

Setting a Trigger for Disk Free Limit Notification

## Step 5: Testing the Notification

Finally, test the notification which you have created. You can trigger this notification for test purposes immediately:

- From the [main menu bar](#)<sup>[175]</sup>, choose **Setup | Account Settings | Notifications**.
- For the respective notification, click on the corresponding **Test** button.

Then, check if the notification was triggered and delivered correctly, depending on what delivery method you defined before. If you do not get a notification (or a defined action is not executed) at all, check the notification logs: From the main menu bar, choose **Logs | System Events | Notifications**. Look for the triggered notification in the table list (verifying that the notification delivery is set up correctly in general) and consider the corresponding message. See section [Logs](#)<sup>[147]</sup> for more information.

## More

This section provides information about additional options you have when working with notifications.

- **Notification Settings:**

You can create schedules to activate notifications only at specific times, for example, only on weekdays. In section **Notification Summarization** you can choose between various options to avoid message floodings. Furthermore, define which user groups will have access to edit this notification. For details about notification settings, refer to section [Account Settings—Notifications](#)<sup>1817</sup>.

- **Content of Emails:**

You can individually adjust the subject, content, header, and footer of emails to your needs. PRTG allows you to use placeholders here. See section [Account Settings—Notifications](#)<sup>1820</sup> for details about editing subject and message, and section [System Administration—Notification Delivery](#)<sup>1843</sup> for details about editing header and footer of emails.

- **Other Triggers:**

An alternative to the state trigger would be to add a **Threshold Trigger**; then you would not need to set up limits explicitly, though, this trigger type would only be suitable for disk free sensors when using the trigger for single sensors, one by one. Free disk sensors have free space in **percent** as primary by default, other sensors have primary channels with the units bytes or seconds. However, threshold triggers only apply to the primary or total channel. General notification triggering by threshold might not work as expected for sensors of the "percentage" type. You can find all available triggers in section [Notifications](#)<sup>1749</sup>.

- **Add a Threshold Trigger to a sensor directly:**

Go on a sensor's detail page and select the **Notifications** tab. Click on **Add Threshold Trigger**, select the desired channel, and provide the condition when this notification will be sent. In this example for free disk space, the setting would be "**When Free Bytes C: (%) channel is Below 20 for at least 60 seconds perform Disk Free Limit Notification**".

- **Notifications with Libraries:**

If your disk devices are spread over many groups, we recommend you to [use a PRTG library](#)<sup>1759</sup> for your disks. Choose **Libraries | All disk space sensors** from the main menu bar, go on the **Notifications** tab, and add a state trigger as described above. **Note:** Not all disk free sensor types might appear. You can add them to this library in the settings of the library node. There you can [filter by type or tag](#)<sup>1768</sup> and add missing sensors this way. You can also filter by priority and other sensor properties.

## 7.8 Libraries

With PRTG's **Libraries** feature you can create special views of your device tree with up-to-the-minute monitoring status information, arranged the way you want it.

Example of a Library

In this section:

- [Introduction](#) <sup>1759</sup>
- [Start Libraries](#) <sup>1760</sup>
- [Libraries List](#) <sup>1760</sup>
- [Working with Libraries](#) <sup>1761</sup>

### Introduction

**Libraries** is a powerful feature which enables you to create additional views of your device tree, which are updated with the same scanning interval as your device tree, showing the same monitoring data, but arranged in a way you want it. This is interesting if you want to show data in different ways, e.g. depending on target groups or use case. For example, you can create a library which contains an overview of all your bandwidth monitoring sensors, regardless of which device they're running on.

Library features include:

- Create libraries containing nodes with monitoring objects from all over your configuration
- Show data from different PRTG probes in one library
- Show different branches of your device tree right next to each other

- Arrange sensors in a tree-like view regardless of which device they are running on
- Filter your entire tree (or parts of it) for sensor type, state, or tag, showing only matching sensors

You can create libraries easily, using **drag&drop** right within your browser.

PRTG comes with several pre-configured standard libraries, which you can use right away. You can also change or delete them, if you like. The following libraries are automatically created when you install PRTG for the first time (visible for the PRTG Administrator user). Some of them will be initially empty, but as you add more sensors, they will be filled automatically according to the filter settings defined for the nodes of the libraries:

- All bandwidth sensors
- All CPU load sensors
- All diskspace sensors
- All memory sensors
- All VMware sensors
- Sensors grouped by priority
- Sensors grouped by state

**Note:** Sensors which are added to libraries are not counted against the maximum number of sensors of your license.

## Start Libraries

Click the **Libraries** entry from the [main menu](#)<sup>1761</sup> to view or add custom views of your network's status and monitoring data. **Hover** to show other menu items. Choose between:

- **All**  
Calls the Libraries feature where you can view or add custom device tree views of your network's status and monitoring data.
- **Add Library**  
Lets you directly [add](#)<sup>1762</sup> a new library.
- **Select Library ›**  
Show existing libraries. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select a library.

## Libraries List

In the **All** view, you see a list of all existing libraries. Using the links next to a library name, you can perform the following actions.

- Click on the name of a library to view it.
- **Delete:** Delete this library.

- **Clone:** Create a clone of this library.
- **Used by:** Show which other monitoring objects use this library.
- Click on the **Add Library** button to add a new library.

Please see also [Working with Table Lists](#)<sup>156</sup>. Additionally, there is multi-edit available. This enables you to change properties of several objects at a time. For more details, please see [Multi-Edit Lists](#)<sup>1736</sup> section.

## Working with Libraries

For detailed information on how to create and edit libraries please see the following sections.

- [Libraries Step By Step](#)<sup>1762</sup>
- [Management](#)<sup>1766</sup>
- [Libraries and Node Settings](#)<sup>1768</sup>
- [Context Menus](#)<sup>1774</sup>

## 7.8.1 Libraries Step By Step

In order to create a new library, follow the steps in this section. In the web interface, click on the **Libraries** entry in the main menu to show the libraries main screen.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

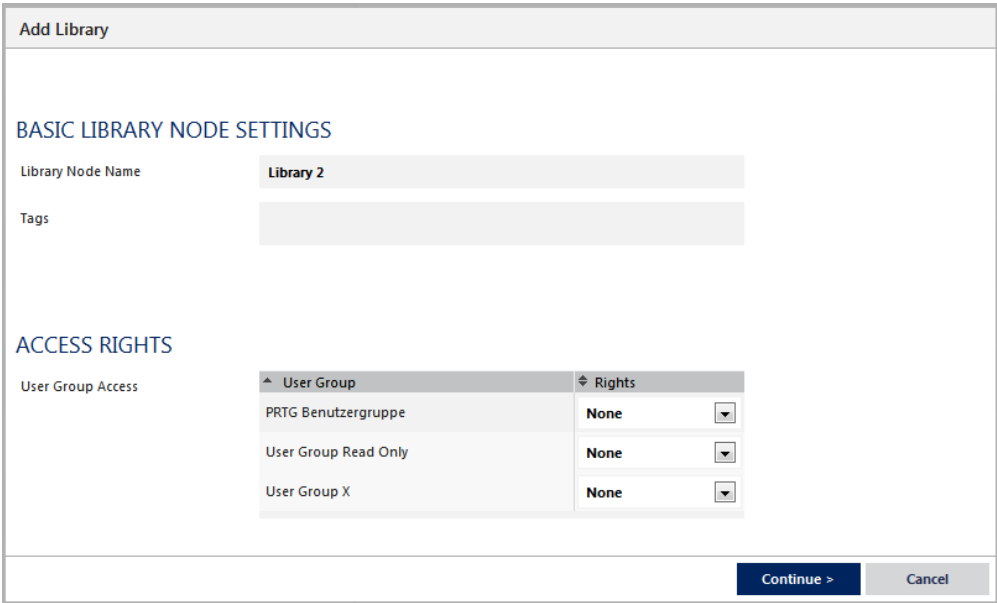

In this section:

- [Step 1: Add Library](#)  1762
- [Step 2: Add Library Nodes](#)  1763
- [Step 3: Set Library Node Display Settings](#)  1763
- [Step 4: View](#)  1764

### Step 1: Add Library

Click on the **Add Library** button. An assistant is shown. Enter a **Library Name**, and define **Tags** and **Access Rights**, if you like. Click on **Continue**.

For detailed information, see [Libraries Settings](#)  1768 section.

Add Library	
<b>BASIC LIBRARY NODE SETTINGS</b>

▲ User Group	◆ Rights
PRTG Benutzergruppe	None ▼
User Group Read Only	None ▼
User Group X	None ▼
<div>Continue &gt; Cancel</div>	

Add Library Assistant Step 1

## Step 2: Add Library Nodes

Click to the **Management** tab. You will see a split screen: On the left side, your library is shown (empty in the beginning), and on the right side, you see a less colorful view of your device tree, as known from the device tree's [Management](#) tab.

The screenshot shows the PRTG Network Monitor interface in the Management tab. The top navigation bar includes Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this, a status bar shows 'New Alarms: 3', 'New Log Entries: 21', and various status icons. The main area is titled 'Library All bandwidth sensors' and has tabs for Overview, Management, Settings, and Notifications. The Management tab is active, showing a split-screen view. On the left, there's a list of sensors categorized by type: 'All bandwidth sensors' (165 sensors), 'iFlow' (4 sensors), 'NetFlow' (12 sensors), 'Packet sniffing' (27 sensors), 'sFlow' (1 of 1050), 'SNMP' (165 sensors), 'Virtuozzo' (4 sensors), and 'WMI' (12 sensors). On the right, a hierarchical tree of network devices is shown, including 'Root', 'Local probe', 'Clone Staging', 'Clone Source', 'Baseline', 'BUVec', 'Google Search Appliance', 'Probe Device', 'Networking', 'Firewalls', 'Cisco ASA Primary', 'Cisco ASA FO/Test', 'Switches', and 'HP 2810-24G - Workgroup'. Each device node has a list of associated sensors. At the bottom, a status bar shows 'PAESSLER', 'PRTG Network Monitor 13.4.9.3736+ [Canary]', '© 2013 Paessler AG', 'PRTG System Administrator', 'Refresh in 567 sec', and '20.12.2013 13:30:52'. The text 'Bandwidth Library in Management Mode' is centered at the bottom.

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new **Library Node**. Repeat this procedure as often as you wish until you have added all desired items to the library. **Note:** When adding single sensors to the library, there can only be one sensor in one library node.

You can also create nested library nodes by adding a new node underneath an existing one.

Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

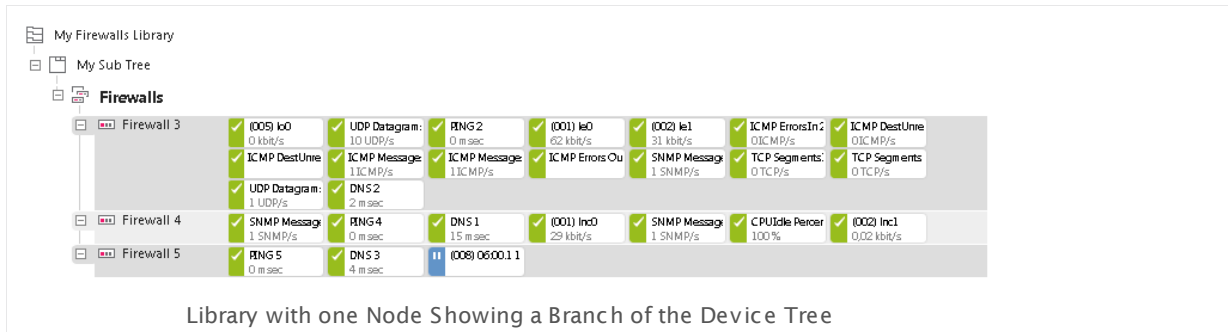

## Step 3: Set Library Node Display Settings

You are still in the library **Management** tab.

Right-click on the name of a **Library Node** and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screen shot below for the library node names "My Sub Tree".

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type**, **Status**, and **Tags**. Only matching sensors will be shown. The screen shot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.

For detailed information, see [Libraries and Node Settings](#) <sup>[1768]</sup> (Overview—Library Node Display Settings) section.

## Step 4: View

Click on the **Overview** tab to see the final appearance of your library. You have the following options:

- Hover an object to view a popup window with recent monitoring and status data.
- Use the sensor state selection bar to select which sensors you want to see for the library: Simply remove check marks for sensor states you want to hide. **Note:** This function is the same you know from the device tree's [Sensor Status Bar](#) <sup>[113]</sup>. The setting is reset the next time you open the library.
- Use the **Device Tree View** selection in the [page header bar](#) <sup>[113]</sup> to change the size of the library display. **Note:** This function is the same you know from the [device tree](#) <sup>[115]</sup>.

- Use the **Search** box in the [page header bar](#)<sup>113</sup> to search the library for a string in object names. Matching objects will be shown full-colored, all others will be grayed out while the filter is active. Click on the small **x** symbol in the search field to reset the filter. **Note:** This function is the same you know from the [device tree](#)<sup>113</sup>.

It depends on the library's access rights and the currently logged in user account if it will be visible to other PRTG users. Also, clicking on objects (for example, on sensors) will lead to more detailed information about the object or to an error message indicating insufficient access rights—depending on user account and access rights.

In libraries, you can right-click objects to access their [Context Menus](#)<sup>1774</sup>.

## 7.8.2 Management

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Click to the **Management** tab. You will see a split screen: On the left side, your library is shown (empty in the beginning), and on the right side, you see a less colorful view of your device tree, as known from the device tree's [Management](#) tab.

The screenshot displays the PRTG Network Monitor Management interface. The top navigation bar includes tabs for Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this, a status bar shows 'New Alarms: 3', 'New Log Entries: 21', and various status indicators. The main content area is titled 'Library All bandwidth sensors' and features a 'Management' tab. On the left, a list of sensors is shown, including 'All bandwidth sensors', 'iFlow', 'NetFlow', 'Packet sniffing', 'sFlow', 'SNMP', 'Virtuozzo', and 'WMI'. On the right, a tree view of the device hierarchy is visible, starting with 'Root' and branching into 'Local probe', 'Clone Staging', 'Baseline', 'Probe Device', 'Networking', 'Firewalls', and 'Switches'. The 'Firewalls' section is expanded, showing details for 'Cisco ASA Primary' and 'Cisco ASA FO/Test'. The bottom of the interface includes a footer with the PRTG logo, version information, and a 'Refresh in 567 sec' indicator.

### Add and Change Library Nodes

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new **Library Node**. Repeat this procedure as often as you wish until you have added all desired items to the library. **Note:** When adding single sensors to the library, there can only be one sensor in one library node.

You can also create nested library nodes by adding a new node underneath an existing one.

Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

### 7.8.3 Libraries and Node Settings

Using the libraries tabs you can access all functionalities and settings for a library.

#### Overview

Click on the **Overview** tab any time to show the current state of your library.

#### Library Node Display Settings

While in the **Overview** tab, click on a **library node**'s name to change its settings. Or, while in the **Management** tab, right-click a library node's name and select **Edit | Settings...** from the context menu. In both cases, the following settings are shown. **Note:** You can only change the settings of a node if it contains monitoring objects already, e.g. groups, devices, or sensors.

##### Basic Library Node Settings

Library Node Name	Enter a meaningful name for the library node.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the library. Tags are not case sensitive.

##### Node Display Settings

Linked Object	Click on the reading-class symbol to change the object which is linked with this library node. A popup window will appear, showing the <a href="#">Object Selector</a> <sup>159</sup> .
Node Type	<p>Select what you want to view for this library node. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Show a subtree of the device tree in the library:</b> View all objects underneath the linked object as a device tree.</li> <li>▪ <b>Show a collection of (filtered) sensors in the library:</b> View all sensors underneath the linked object (only sensors are shown). You can combine several filters with each other (see below).</li> </ul>
Filter By Type	<p>This option is visible only if collection of sensors is enabled above. Select if you want to filter the sensor list by a certain type. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Show all sensor types:</b> Do not filter for a sensor type.</li> </ul>

Node Display Settings	
	<ul style="list-style-type: none"> <li>▪ <b>Show specific sensor types only:</b> Filter the sensor list of the linked object for certain sensor type(s).</li> </ul> <p><b>Note:</b> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>
Select Sensor Types	<p>This option is visible only if filtering by type is enabled above. A list of all sensor types is shown, currently available sensor types are shown in bold letters for your convenience. Set a check mark in front of each sensor type you want to include in the library node view. You can also select and deselect all items by using the check box in the table head.</p> <p><b>Note:</b> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>
Filter By Status	<p>This option is visible only if collection of sensors is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Show all sensor states:</b> Do not filter for a sensor status.</li> <li>▪ <b>Show sensors with a specific status only:</b> Filter the sensor list of the linked object for sensors in certain states.</li> </ul>
Select Sensor States	<p>This option is visible only if filtering by sensor state is enabled above. A list of sensor states is shown. Set a check mark in front of each status you want to include in the library node view. Choose from:</p> <ul style="list-style-type: none"> <li>▪ <b>Unknown</b></li> <li>▪ <b>Up</b></li> <li>▪ <b>Warning</b></li> <li>▪ <b>Down</b></li> <li>▪ <b>Paused</b></li> <li>▪ <b>Unusual</b></li> <li>▪ <b>Down (Acknowledged)</b></li> <li>▪ <b>Down (Partial)</b></li> </ul> <p>You can also select and deselect all items by using the check box in the table head.</p> <p><b>Note:</b> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>

Node Display Settings	
Filter By Tags	<p>This option is visible only if collection of sensors is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Show all sensor tags:</b> Do not filter for a tag.</li> <li>▪ <b>Show objects with a specific tag only:</b> Filter the sensor list of the linked object for sensors with a certain tag. <b>Note:</b> The tag of a sensor can also be <a href="#">inherited</a><sup>[87]</sup> by a parent object.</li> </ul>
Select Tags	<p>This option is visible only if collection of sensors is enabled above.</p> <p>A list of all available tags is shown. Set a check mark in front of each tag you want to include in the library node view. You can also select and deselect all items by using the check box in the table head.</p> <p><b>Note:</b> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>
Filter By Priority	<p>This option is visible only if collection of sensors is enabled above. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Show all priorities:</b> Do not filter for the <a href="#">priority setting</a><sup>[160]</sup> of a sensor.</li> <li>▪ <b>Show objects with specific priority only:</b> Filter the sensor list of the linked object for sensors with specific priority. <b>Note:</b> The priority setting of a group, device, or sensor is ignored here; only the priority setting of the sensor itself is regarded.</li> </ul>
Select Priority	<p>This option is visible only if collection of sensors is enabled above. Define which priority setting sensors must have to appear in this collection. Set a check mark in front of each priority you want to include in the library node view. Choose from:</p> <ul style="list-style-type: none"> <li>▪ ***** (highest)</li> <li>▪ *****</li> <li>▪ *****</li> <li>▪ ***</li> <li>▪ **</li> <li>▪ * (lowest)</li> </ul> <p><b>Note:</b> This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.</p>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

**Note:** After applying filters it might take several seconds for the changes to become visible. This is due to internal filter processes running in the background.

## Management

Click on the **Management** tab to edit the contents of your library, for example, to add items to the library using drag&drop. For detailed descriptions, please see [Management](#) <sup>1766</sup> section.

## Settings

Click on the **Settings** tab to open a library's general settings.

Basic Library Settings	
Library Name	Enter a meaningful name for the library.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the library. Tags entered here are <a href="#">inherited</a> <sup>87</sup> to all library nodes underneath. Tags are not case sensitive.

## Access Rights

### User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited:** Use the settings of the parent object.
- **None:** Users in this group cannot see or edit the object. The object does not show up in lists and in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read:** Users in this group can see the object and review its monitoring results.
- **Write:** Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full:** Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the [System Administration—User Groups](#)<sup>1861</sup> settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details about access rights, please see section [User Access Rights](#)<sup>94</sup>.

**Note:** When giving access rights to a user group, all members of this user group will be able to see the objects in the library just as seen by the user who originally created the library.

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Notifications

You can define notification triggers for any kind of object libraries. This is even possible for dynamic libraries which can change with every scanning interval, for example, when you filter a library for the sensor status or priority. For details about how to use notifications, please see section [Notifications](#)<sup>1746</sup>.

## Comments

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

## History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the PRTG user which conducted the change, and a message. The history log keeps the last 100 entries.

## Delete

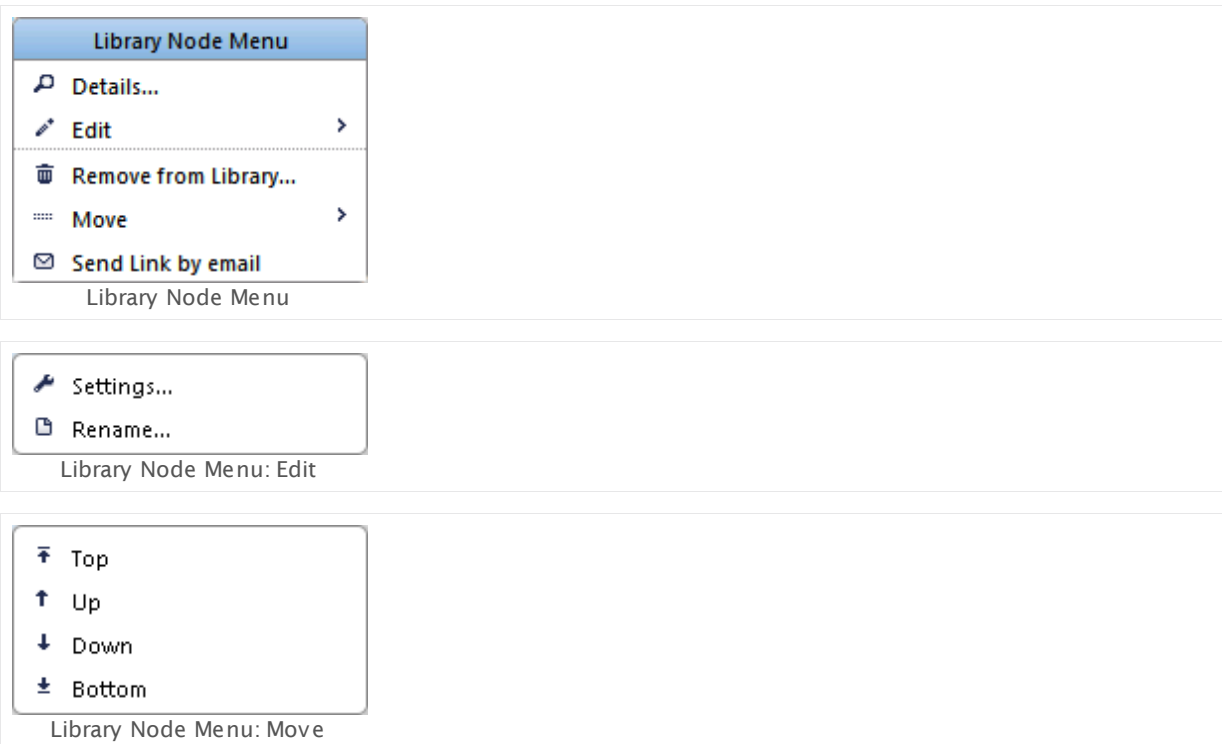

You can delete the entire library any time by clicking on the trash symbol on the right.

## 7.8.4 Context Menus

On right-click, there are different context menus available.

### Library Node Menu

While in the **Overview** or the **Management** tab, right-click on any library node to show its context menu.

- Select either **Details...** or **Edit | Settings...** to get to the [Libraries and Node Settings](#)<sup>1768</sup>.  
**Note:** While in the **Overview** tab, these settings are also accessible via left-click on the node's name.
- **Edit | Rename...** will give you an option to rename the library node quickly.
- **Remove from Library...** will remove this library node from the current library. **Note:** This will not delete any objects in your device tree.
- The **Move | ...** options will move the library node up and down within the library.
- Click on the **Send Link by email** entry to open a new email using your system's standard email client. It will contain a direct link to the page you're currently viewing.

### Monitoring Objects Menus

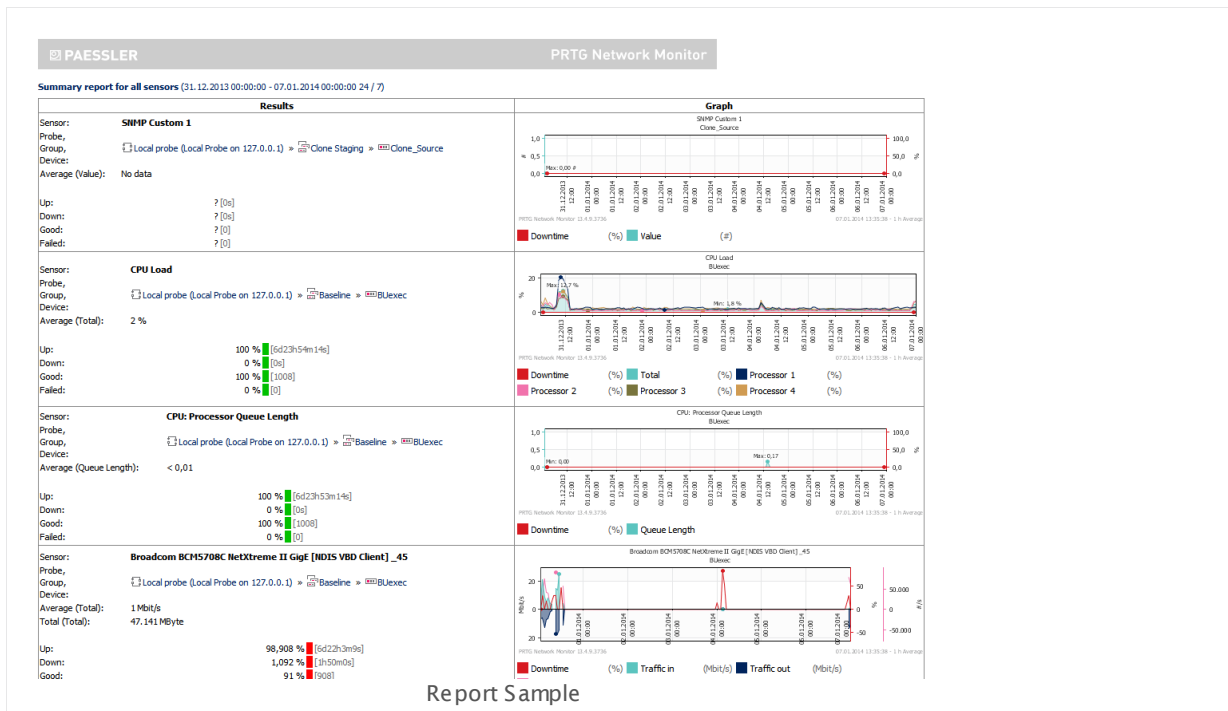

In libraries there are the same [Context Menus](#)<sup>163</sup> available you already know from the device tree. With one exception: While accessing these menus within libraries, the **Move** and **Delete** options are disabled to avoid accidental changes to your device tree.

## 7.9 Reports

Reports are used to analyze historic monitoring results over a specified time such as one or more days, one month, or an entire year. You can create reports for all, or only for certain sensors.

### Introduction

PRTG includes a powerful reporting engine for ad-hoc, as well as scheduled report generation in HTML and PDF format. Thus, reports can be run on demand or on a regular basis (for example, once a day). You can create reports for one single sensor, or you choose a range of sensors you want to create a report for. The content and layout of the report is controlled by the report template of your choice and is the same for all sensors in a report.

The sample report above shows a report data for devices on a local probe. You can see graphs for the preceding week, plus data tables with numeric results.

### Start Reports

Click the **Reports** entry from the [main menu](#) <sup>182</sup> to view or add reports of your monitoring data. **Hover** to show other menu items. Choose between:

- **All**  
Calls the Reports feature where you can view or add reports of your monitoring data.
- **Add Report**  
Lets you directly add a new report.

### ▪ Select Report ›

Show existing reports. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select a report.

## Reports Overview

The screenshot displays the PRTG Network Monitor interface. At the top, there's a navigation bar with links like Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this, a status bar shows 'New Alarms 3', 'New Log Entries 32', and various status icons. The main section is titled 'Reports' and contains a table with the following columns: Object, Template, Period, Schedule, Email, Status, Last Run, Next Run, and Links. The table lists 20 reports, including 'Active Directory', 'Exchange 2010', 'Firewall Report', 'MS Systems - Iops', 'NetApp', 'Ping', 'SharePoint 2010', 'SNMP Traffic Benchmarking', 'SQL Server', 'Summary report for all sensors', 'Top 100 Busy/Idle Processor Sensors', 'Top 100 Fastest/Slowest HTTP Sensors', 'Top 100 Fastest/Slowest PING Sensors', 'Top 100 Free/Full Disk Space Sensors', 'Top 100 Most/Least Used Bandwidth', 'Top 100 Most/Least Used Memory Sensors', 'Top 100 Uptime/Downtime Report', 'vCenter VMs', 'WAN Firewall1', and 'Windows\_CPU'. Each row has a 'Links' column with buttons for 'Edit', 'Clone', and 'Delete'. At the bottom of the table, there is an 'Add Report' button. Below the table, there is a section titled 'List of Reports'.

In the **All** view, you see a list of all existing reports. Every line shows information about one report:

- **Period:** The time span covered by the report.
- **Schedule:** Shows if a schedule is set to regularly execute the report automatically.
- **Email:** If a schedule **and** an email address is set in the report settings, this shows the email address the report is automatically sent to.
- **Status:** Shows the current status of the report.
- **Last Run:** If a schedule is set in the report settings, this shows when the report was run the last time.
- **Next Run:** If a schedule is set in the report settings, this shows when the report will be run the next time.

Using the buttons at the end of a line, you can **Edit**, **Clone**, and **Delete** the respective report.

Please see also [Working with Table Lists](#)<sup>156</sup>. Additionally, there is multi-edit available. This enables you to change properties of several objects at a time. For more details, please see [Multi-Edit Lists](#)<sup>1736</sup> section.

Click on the **Add Report** button to add a new report, or click on the name of an existing report to view and edit its settings. You can also run a pre-configured report easily by clicking on its name and then using the options in the **Run Now** tab. For both options, please see [Reports Step By Step](#)<sup>1778</sup> section.

## Working With Reports

For detailed information on how to create, edit, and schedule reports, please see the following sections:

- [Reports Step By Step](#)<sup>1778</sup>
- [View and Run Reports](#)<sup>1781</sup>
- [Reports Settings](#)<sup>1784</sup>

## Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

Time Span in Report	Minimum Level of Detail (Average Interval)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

A report for a time span of more than 500 days is not possible. If you try to set a larger time span, it will be reduced to 365 days automatically.

- [Historic Data Reports](#)<sup>133</sup>

## 7.9.1 Reports Step By Step

In order to create a new report, or run an existing one, follow the steps in this section. In the web interface, click on the **Reports** entry in the main menu to show the reports main screen.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

### Quick Start: Run an Existing Report

PRTG is delivered with several pre-configured reports. In order to use one of them, click on a report's name in the reports main screen, select the **Settings** tab. The other steps are the same as for new reports. Although some settings are already given, we recommend checking the settings. For example, check the sensors that will be included in the report. For some reports that come with PRTG there are no sensors added yet. Continue with [Step 3](#) <sup>1778</sup> in this section.

### Step 1: Add Report

Click on the **Add Report** button to add a new report. An assistant is shown where you can define various settings. First, enter a **Report Name**.

## Step 2: Select a Template

In the **Template** section, select one of the report templates from the list. This will define the overall look of your report and affect in which detail (interval) monitoring data is included. For a detailed description on the available options, please see [Reports Settings](#)<sup>1784</sup> section. If you are not sure, try a template that appears most suitable to you. You can change all settings later.

## Step 3: Define Additional Settings

Select a **Security Context** (best choose **PRTG System Administrator**, if available), your **Timezone**, and **Paper Size** for PDF generation. For detailed information, please see [Reports Settings](#)<sup>1784</sup> section.

## Step 4: Select Nodes and Sensors

Choose the sensors you want to include in the report. First, when running in a [cluster](#)<sup>81</sup>, define the **Cluster Node** the monitoring data will be taken from. Select a specific node from the list. If you select **All nodes**, a report with data from all of your cluster nodes will be created, but only the primary channel of every sensor will appear in the report.

Every report will show monitoring results from sensor data. There are two ways to include sensors in a report: You can either add sensors manually, or by tag. In the **Add Sensors by Tag** field, enter one or more tags that matches the sensor range you want a report for. For example, enter the tag **bandwidthsensor** to include all sensors that measure bandwidth (or select it from the list of tags which PRTG suggests). PRTG provides this tag as default when adding bandwidth sensors; so this tag typically gathers all bandwidth sensors, unless you have configured your system differently. You can enter several tags; hit the enter key, comma, or space after providing one tag and enter the next one. Use the **Filter Sensors by Tag** field to explicitly filter sensors with certain tags from the bulk of tags or manually selected sensors defined above.

Tagging is a great tool to group sensors or other objects. For more information, see [Tags](#)<sup>1789</sup> section. You can also leave the tag fields empty and only choose specific sensors manually later.

### Step 5: Decide on a Schedule and Additional Settings

In the **Report Schedule** section, choose if you want to run the report on a regular basis or on demand only. Also choose which time **Period** will be covered by the report, and if you want to show percentiles, add report comments, or special access rights. For detailed information, please see [Reports Settings](#)<sup>1784</sup> section.

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

### Step 6: Check and Adjust the Sensors Included

When settings are saved, switch to the **Sensors Selected by Tag** tab to see a list of all sensors that were added by the tag(s) you defined in step 4. To change tags, go back to the **Settings** tab. You can additionally add sensors manually. To do so, switch to the **Select Sensors Manually** tab. See [Reports Settings](#)<sup>1791</sup> section for detailed information. The final report will show sensors from both manual and by tag selection.

### Step 7: Run Report

Switch to the **Run Now** tab, select the current or previous period, and in the **Processing Options** select **View Report as HTML**. Click the **Run Report** button. The report will be generated in a new browser window or tab immediately. Depending on the number of selected sensors and the used template, it may take a few minutes until you see the report. If you do not want to wait, close the newly opened browser window or tab and select a PDF option in the **Processing Options**. Click on the **Run Report** button again. The report will then be generated in the background and you will get a **ToDo ticket** or email once it is finished.

**Note:** For large PDF reports, PRTG will automatically split the output into separate files to avoid huge PDF files. You can change the number of sensors included into each PDF file by editing the report templates manually. See [More](#)<sup>1793</sup> section of [Reports Settings](#)<sup>1794</sup>.

## 7.9.2 View and Run Reports

In the web interface, click on the **Reports** entry in the main menu to show the reports main screen. Click on a report's name to select it. Using the reports tabs you can access all functionalities and settings for this report. Click on the **Go to all reports** button at the bottom of the page to return to the list of Reports.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

### Run Now

In the **Run Now** tab you can execute a report immediately with the settings configured.

Run Report "[Name]"	
Report for	<p>Define the time span covered by the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Current Period:</b> Use monitoring data of the current period. The actual time span depends on the report period type defined in the report's <a href="#">settings</a><sup>1784</sup>. It can be today, this week, this month, or this year.</li> <li>▪ <b>Previous Period:</b> Use monitoring data of the last period. The actual time span depends on the report period type defined in the report's <a href="#">settings</a><sup>1784</sup>. It can be yesterday, last week, last month, or last year.</li> <li>▪ <b>Select A Period:</b> Use monitoring data of a period other than current or previous. Select below.</li> <li>▪ <b>Select Date Range Manually:</b> Define a custom time span for the monitoring data that will be used. Set start and end date below.</li> </ul>
Date Range	<p>This selection is only visible if the period option is enabled above. From the list, select a data range for which the report will be generated. The actual time spans shown depend on the available monitoring data and on the report period type defined in the report's <a href="#">settings</a><sup>1784</sup>. It can be days, weeks, months, or years.</p>
Start Date	<p>This selection is only visible if the date range option is enabled above. Define the begin of the time span for which the report will be generated. Click in the field and select a date from the calendar. Make sure you define a valid period.</p>

**Run Report "[Name]"**

End Date	This selection is only visible if the date range option is enabled above. Define the end of the time span for which the report will be generated. Click in the field and select a date from the calendar. Make sure you define a valid period.
Quick Range	This selection is only visible if the date range option is enabled above. Choose between different pre-defined ranges by simply clicking on it. With each click the <b>Start</b> and <b>End Date</b> fields above will be changed accordingly.

**Processing Options**

File Format and Delivery	<p>Define how you want to view the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>View Report as HTML:</b> Directly view the report in your web browser. It will be loaded in a new browser window or tab.</li> <li>▪ <b>Create and store PDF file:</b> Create a PDF file of the report and store it. Once finished, you will find it in the <b>Stored Reports</b> tab and a <a href="#">ToDo ticket</a><sup>150</sup> will be created. By default, PRTG sends out a notification mail to the administrator in this case.</li> <li>▪ <b>Create PDF file, store it and send by email:</b> Create a PDF file of the report, store it, and send it via email once it is finished.</li> </ul> <p><b>Note:</b> For large PDF reports, PRTG will automatically split the output into separate files to avoid huge PDF files. You can change the number of sensors included into each PDF file by editing the report templates manually. See <a href="#">More</a><sup>1783</sup> section below.</p> <p><b>Note:</b> In order to create PDF files, ensure that the print spooler service is running on the system with your PRTG server.</p>
Target Email Address	<p>This option is only visible if sending by email is selected above. Please enter a valid email address the report will be sent to. <b>Note:</b> Configuration for outgoing email can be changed in the <a href="#">System Administration—Notification Delivery</a><sup>1043</sup> settings.</p>
Compression	<p>This option is only visible if sending by email is selected above. Specify if the attached report files will be compressed before sending. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Uncompressed:</b> The report files will not be compressed before they are sent by email.</li> <li>▪ <b>Compressed:</b> The report files will be compressed to a ZIP file before they are sent by email.</li> </ul>

Click on the **Run Report** button to start report generation. Depending on the number of selected sensors, this may take a while. If you experience a long waiting time when generating HTML reports for immediate view, please consider using one of the PDF options. You can then view the report as soon as it's finished.

**Note:** Any sensor graphs in your report will only show the channels that are enabled via the **Show in Charts** option in the [Sensor Channels Settings](#)<sup>1709</sup> of the respective sensor.

## Stored Reports

In the **Stored Reports** tab you can view PDF reports created in the past. Simply click on a name to open the report. Reports are stored until they are deleted according to the data purging settings of your PRTG configuration. You can set data purging limits for reports in the [System Administration—Core & Probes](#)<sup>1852</sup> settings.

## Other Tabs

For all other tabs, please see [Reports Settings](#)<sup>1784</sup> section.

## More

Knowledge Base: Can I change the number of PDFs created by a report?

- <http://kb.paessler.com/en/topic/11863>

### 7.9.3 Reports Settings

In the web interface, click on the **Reports** entry in the main menu to show the reports main screen. Click on a report's name to select it. Using the reports tabs you can access all functionalities and settings for this report. Click on the **Go to all reports** button at the bottom of the page to return to the list of Reports.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

#### Run Now

In the **Run Now** tab you can execute a report immediately with the settings configured. Please see [View and Run Reports](#)<sup>1781</sup> section.

#### Stored Reports

In the **Stored Reports** tab you can view reports created in the past. Please see [View and Run Reports](#)<sup>1783</sup> section.

#### Settings

Click on the **Settings** tab to open a report's settings.

Basic Report Settings	
Report Name	Enter a meaningful name to identify this report.
Template	<p>Select a template for the report. This will define the overall look of your report. There are several report templates delivered with PRTG. They also define in which detail (interval) monitoring data is included. You can choose from templates in the following categories:</p> <ul style="list-style-type: none"> <li>▪ <b>Data Table Only:</b> Create a report with data tables only. Choose from several intervals.</li> <li>▪ <b>Graph Only:</b> Create a report with graphs only. Choose from several intervals.</li> <li>▪ <b>Graph with Data Table:</b> Create a report with graphs and data table. Choose from several intervals.</li> </ul>

### Basic Report Settings

	<ul style="list-style-type: none"> <li>▪ <b>List of Sensors:</b> Create a report in a compact sensor list style. This is available with and without graphs.</li> <li>▪ <b>Top 10 Uptime/Downtime:</b> Create a report with up to 10 objects with the highest uptime and downtime each. You can choose between data in percent and hours.</li> <li>▪ <b>Top 100 Highest and Lowest:</b> Create a report with up to 100 objects with the highest and lowest average values. Choose from different intervals.</li> <li>▪ <b>Top 100 Uptime/Downtime:</b> Create a report with up to 100 objects with the highest uptime and downtime each. You can choose between data in percent and hours.</li> </ul> <p>Monitoring data within an interval is averaged. See also the comment on data averaging in the <a href="#">Reports</a> (Automatic Averaging) section. For information on how to modify templates, please see <a href="#">More</a> section below.</p>
Security Context	<p>Define the user account that will be used for access to monitoring data. The report will only contain objects which the selected <a href="#">user</a> is allowed to view. Please choose a user from the list. The available users depend on your configuration. By default, this is the user that created the report. PRTG Administrator users can change this setting.</p>
Timezone	<p>Define the time zone that will be used for all date-specific settings in this report (see below). Select a time zone from the dropdown list.</p>
Paper Size	<p>Define the paper size in which PDF reports will be created. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>A4:</b> Use German DIN A4 format.</li> <li>▪ <b>Legal:</b> Use US legal paper format.</li> <li>▪ <b>Letter:</b> Use US letter paper format.</li> </ul>

### Sensors

Cluster Node	<p>This field is only visible when running PRTG in <a href="#">Clustering</a> mode. Define the cluster node the report will take monitoring data from. Choose a cluster node from the list. The available options are specific to your configuration. Select <b>All nodes</b> to create a report with data from all of your cluster nodes. <b>Note:</b> A report for all nodes will include data of the primary sensor channels only, not for other sensor channels.</p>
--------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Sensors	
Add Sensors Manually	If you want to manually choose the sensors included in this report, please save settings and switch to the <a href="#">Select Sensors Manually</a> tab.
Add Sensors by Tag	Define the sensors included in this report by tag. Enter one or more tags; hit enter, space, or comma to confirm a tag. The report will cover all sensors that have at least one of the tags. Please enter a string or leave the field empty. <b>Note:</b> <a href="#">Tags are inherited</a> invisibly and automatically. So, for example, if you enter the tag of a group here, the report will include all sensors within this group. For detailed information, see <a href="#">Inheritance of Settings</a> section. For sensors that are added by tag, all sensor channels are included in the report automatically, except <b>All nodes</b> is selected in the <b>Cluster Node</b> selection above.
Filter Sensors by Tag	Further filter sensors. This is used in combination with sensors that are added manually, or added implicitly with their manually added parent objects. From those sensors, only the ones with the tags entered here will be included. Enter one or more tags to include sensors in the report; hit enter, space, or comma to confirm a tag. Please enter a string or leave the field empty.

Schedule	
Report Schedule	<p>Define when the report will be run. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No schedule (run interactive/on-demand only):</b> Only use the options in the <b>Run Now</b> tab to start generation of this report manually.</li> <li>▪ <b>Every full hour:</b> Run this report every 60 minutes.</li> <li>▪ <b>Every day at a specific hour:</b> Run this report every 24 hours.</li> <li>▪ <b>Every specific day of a week:</b> Run this report every 7 days. Specify the day below.</li> <li>▪ <b>Every specific day of a month:</b> Run this report on a specific day every month. Specify below.</li> <li>▪ <b>The day after a quarter is finished (i.e. at 1. April for the 1. January - 31. March Quarter):</b> Run this report for every quarter of the year.</li> <li>▪ <b>Every specific date:</b> Run this report on a specific date every year. Specify below.</li> </ul>

Schedule	
Specify Hour	This setting is only visible if specific hour is selected above. From the list, please select the hour you want to run the report at. PRTG will automatically choose a suitable time within this hour, usually at the beginning of it.
Specify Day	This setting is only visible if the day of week or day of month option is selected above. From the list, please select a day of week or a date of the month you want to run the report. When selecting <b>Last</b> , the report will always run on the last day of the month, regardless of how many days the month has. When selecting a date that does not exist in every month, e.g. the 30th in May, PRTG will automatically run the report on the last day of this month.
Specify Date	This setting is only visible if the specific date option is selected above. Please enter a valid date in the form <b>DD.MM</b> , e.g. <b>31.12</b> . The report will be run annually on this date.
Scheduled Processing	<p>This setting is only visible if one of the schedule options is selected above. Define what will be done when generating a report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Save report to disk and send it by email:</b> Create a PDF file of the report, store it, and send it via email. You will find the report in your emails and in the <b>Stored Reports</b> tab. Define an email address below.</li> <li>▪ <b>Save report to disk only:</b> Create a PDF file of the report and store it. Once finished, you will find it in the <b>Stored Reports</b> tab and a ToDo ticket will be created. By default, PRTG will send out a notification mail to the administrator in this case.</li> <li>▪ <b>Send report by email only:</b> Create a PDF file of the report and send it via email once it is finished. The report is not permanently stored, but only emailed. Define an email address below.</li> </ul> <p><b>Note:</b> For large PDF reports, PRTG will automatically split the output into separate files to avoid huge PDF files. You can change the number of sensors included into each PDF file by editing the report templates manually. See <a href="#">More</a><sup>1793</sup> section below.</p>
Email Address	This setting is only visible if a send by email option is selected above. Please enter a valid email address the report will be sent to. To enter more addresses, separate them by comma. PRTG will send a message with all recipients in the "To" field of the email. <b>Note:</b> Configuration for outgoing email can be changed in the <a href="#">System Administration—Notification Delivery</a> <sup>1843</sup> settings.

Schedule	
Send to User Group	<p>This setting is only visible if a send by email option is selected above. From the drop down list, please choose a user group to send an email with the report to all members of this group (you can edit user groups under <a href="#">System Administration—User Groups</a>). <b>Note:</b> If you define individual email addresses (see field above) and a user group, the report will be sent to the individual email addresses as well as to the members of the selected user group. In both cases, PRTG will send one message with all recipients in the "To" field of the email.</p>
Compression	<p>This setting is only visible if a send by email option is selected above. Specify if the attached report files will be compressed before sending. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Uncompressed:</b> The report files will not be compressed before they are sent by email.</li> <li>▪ <b>Compressed:</b> The report files will be compressed to a ZIP file before they are sent by email.</li> </ul>

Period	
Reported Period	<p>Define the time span covered by the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Current:</b> Use monitoring data of the current period. Define the period type below.</li> <li>▪ <b>Previous:</b> Use monitoring data of the last period. Define the period type below.</li> </ul>
Report Period Type	<p>Define the type of period you want to create a report for. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Day</b></li> <li>▪ <b>Week</b></li> <li>▪ <b>Month</b></li> <li>▪ <b>Quarter (January-March, April-June, etc.)</b></li> <li>▪ <b>Year</b></li> </ul> <p>Depending on your selection, different period selections are shown below.</p>
Day Period	<p>This setting is only visible if day period type is selected above. Define the hours when a day starts and ends. Choose from the list of hours. Default setting is <b>0:00-23:59</b>.</p>

Period	
Week Period	<p>This setting is only visible if week period type is selected above. Define when a week starts and ends. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Monday-Sunday</b>: A reported week will start on Monday.</li> <li>▪ <b>Saturday-Friday</b>: A reported week will start on Saturday.</li> <li>▪ <b>Sunday-Saturday</b>: A reported week will start on Sunday.</li> </ul>
Month Period	<p>This setting is only visible if month period type is selected above. Define when a month starts and ends. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>1.-last day</b>: A reported month will start on the first and end on last of the month.</li> <li>▪ <b>15.-14.</b>: A reported month will start von 15th and end on 14th of the month.</li> </ul>
Year Period	<p>This setting is only visible if year period type is selected above. Define when a year starts and ends. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>1/1-12/31</b>: A reported year will start on January 1st.</li> <li>▪ <b>7/1-6/30</b>: A reported year will start on July 1st.</li> </ul>
Report only for specific hours-of-day (Schedule)	<p>Include certain time spans within the defined period only. When a schedule is selected, only monitoring data for specified hours or weekdays within the defined period are included in the report. Select <b>None</b> to include all available monitoring data in the report, or choose a schedule. For example, select the schedule <b>Weekdays</b> to exclude all weekends from the report. The available schedules depend on your configuration. For more information, please see <a href="#">Account Settings—Schedules</a> <sup>1827</sup> section.</p>

Percentile Settings	
Show Percentile	<p>Define if <a href="#">percentiles</a> <sup>2076</sup> will be included in the report. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Off</b>: Do not show percentiles</li> <li>▪ <b>On</b>: Add a column to data tables, showing percentiles for every sensor channel.</li> </ul> <p><b>Note:</b> Percentiles are not available for all report templates. If a template does not support percentiles, they will simply not show up in the report, even when you enable this setting.</p>

Percentile Settings	
Show Percentile	This setting is only visible when showing percentiles. Enter the percentile number you want to calculate. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded.
Percentile Average (seconds)	This setting is only visible when showing percentiles. This is the averaging interval in seconds, which is used for percentile calculation. Default value is 300 which is equivalent to 5 minutes.
Percentile Mode	<p>This setting is only visible when showing percentiles. Choose the mode for percentile calculation:</p> <ul style="list-style-type: none"><li>▪ <b>Discrete:</b> Discrete percentile chooses the next smaller discrete value.</li><li>▪ <b>Continuous:</b> Continuous percentile interpolates between discrete values.</li></ul> <p>For details, see section <a href="#">Calculating Percentiles</a> .</p>

Report Comments	
Introduction	Define a custom text that will show up on the first page of the report. Please enter a string or leave the field empty.
Footer Comments	Define a custom text that will show up on the last page of the report. Please enter a string or leave the field empty.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its settings.</li> <li>▪ <b>Write:</b> Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, as well as review and edit its settings and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> <sup>1861</sup> settings.</p>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Select Sensors Manually

Click on the **Select Sensors Manually** tab to manually choose sensors that will be included in the report. You will see a split screen: On the left side, your list of objects is shown (empty in the beginning), and on the right side, you see a less colorful view of your device tree, as known from the device tree's [Management](#) <sup>222</sup> tab. Adding objects to the report is very easy.

## Part 7: Ajax Web Interface—Advanced Procedures | 9 Reports

### 3 Reports Settings

Manual Selection for Reports

#### ■ Add Items

From the device tree on the right side, drag objects and drop them on the list on the left side. This can be entire probes, groups, devices, or single sensors. Each dropped object will be added immediately as a new list item. Repeat this procedure as often as you wish until you have added all desired items to the library. **Note:** Objects that already exist in the list on the left side will be grayed out in the device tree on the right side.

#### ■ Select Sensor Channels

If in the report settings one specific cluster node is selected **and** if you are adding a sensor to the selection, you can specify the sensor channels that will be included in the report. By default, all channels are selected. To exclude a channel from the report, simply remove the check mark in front of a channel's name. **Note:** If **All nodes** is selected in the report's **Cluster Node** selection, the channel selection is not available, but only the primary channel of every sensor is included automatically.

#### ■ Remove

To remove any objects from the report, click on the trash can symbol next the respective list item, or select several list items while holding down the **Ctrl** key and click on the green trash symbol appearing at the top of the list.

Your selection is saved automatically, and there is no undo function. **Note:** The final report will include both sensors selected manually and those selected by tag.

## Sensors Selected by Tag

Click on the **Sensors Selected by Tag** tab to view all sensors that are added to the report depending on the report's **Add Sensors by Tag** setting. In the [table list](#)<sup>156</sup>, you will see all sensors that are added by tag. This is for your information only, you cannot change sensors here. However, you can switch to the report's **Settings** tab and change the tabs that are used to add sensors. Additionally, you can also exclude sensors with certain tabs there. The final report will include both sensors selected manually and those selected by tag.

For sensors that are added by tag, all sensor channels are included in the report automatically, except **All nodes** is selected in the report's **Cluster Node** selection. In this case, only the primary channel of every sensor is included. **Note:** The final report will include both sensors selected manually and those selected by tag.

## Comments

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

## 7.10 Maps

With PRTG's **Maps** feature (some people might call this 'dashboards') you can create web pages with up-to-the-minute monitoring status information in a customizable layout. Using this unique concept, you can also make your overview pages of live data publicly available, if you like.

Example of a PRTG Map

In this section:

- [Introduction](#) <sup>1794</sup>
- [Start Maps](#) <sup>1795</sup>
- [Maps Overview](#) <sup>1795</sup>
- [Maps Rotation](#) <sup>1796</sup>
- [Working with Maps](#) <sup>1796</sup>

### Introduction

There are countless possibilities for the implementation of maps. For example, this feature can be used to:

- Create network maps with status icons for each device on the map.

- Create quick views of your network that can be shown on network operations center screens.
- Create a quick network overview for publishing on the Intranet, allowing at-a-glance information for management of other employees.
- Create a custom view of the most important sensors in your monitoring setup.
- Create Top 10 lists of the sensors of a specific group or device.

Technically, a map is a usual HTML web page. You can build a schema of your network by choosing from hundreds of device icons and connect them with lines. A map can consist of the following elements:

- A set of map items, which can include device icons, sensor status icons, graphs, data tables, lists of sensors, connection lines, geographical maps, or custom HTML code.
- An optional background image (a JPG, PNG, or GIF file, for example, your company logo or a graphical view of your network).

You can also specify the size of the map. Using the AJAX-based map editor, you can place the items anywhere on the map and you can also change their size. Each map has a unique URL which can be used to link to the map. Users who want to access the map either need an account in your PRTG installation, or can access a public URL of the map if you allow the **Public Access** feature. Public maps contain a unique **Map ID** access key in the URL to block unwanted visitors.

## Start Maps

Click the **Maps** entry from the [main menu](#)<sup>182</sup> to view or add custom views of your network's status and monitoring data. **Hover** to show other menu items. Choose between:

- **All**  
Calls the Maps feature where you can view or add custom views of your network's status and monitoring data.
- **Add Map**  
Lets you directly [add](#)<sup>1797</sup> a new map.
- **Select Map ›**  
Show existing maps. **Hover** to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

## Maps Overview

In the **All** view, you see a list of all existing maps. Using the links next to a map name, you can perform the following actions.

- Click on the name of a map to view it.
- Click on the **Edit** button to adjust the settings of this map.
- Click on the **Clone** button to create an exact copy of this map. As soon as you click, the map is cloned and the cloned map's settings are shown.

- Click on the **Delete** button to remove this map.
- Click on the **Add Map** button to add a new map.

Please see also [Working with Table Lists](#)<sup>156</sup>. Additionally, there is multi-edit available. This enables you to change properties of several objects at a time. For more details, please see [Multi-Edit Lists](#)<sup>1736</sup> section.

## Map Rotation

To show several maps in a rotation, mark the desired maps using [multi-edit](#)<sup>1736</sup> and then select **Map Rotation** from the multi-edit menu. You will be redirected to a page where the rotation is shown. This requires login credentials for PRTG.

It is also possible to set up a **public map rotation** without login: Allow public access in the [settings](#)<sup>1806</sup> of the desired maps. Use the corresponding map IDs with its secret keys to build a URL that calls a public map rotation. The URL must have this format: the address of your PRTG server, followed by `/public/mapshow.htm?ids=`. Then list the IDs of the desired maps, each separated by a comma. Each map ID has to be connected with its secret key using a colon:  
`http://yourprtgserver/public/mapshow.htm?ids=mapid1:secretkey1,mapid2:secretkey2,mapid3:secretkey3`

While a map rotation is shown, you can change the refresh interval any time when hovering the arrows symbol in the lower right corner. Choose between **10**, **30**, or **60** seconds, **10** minutes or **Refresh** now.

## Working with Maps

For detailed information on how to create and edit maps, and to learn how to make them accessible to others, please see the following sections.

- [Maps Step By Step](#)<sup>1797</sup>
- [Maps Designer](#)<sup>1800</sup>
- [Maps Other Settings](#)<sup>1806</sup>

### 7.10.1 Maps Step By Step

In order to create a new map, follow the steps in this section. In the web interface, click on **Maps** entry in the main menu to show the maps main screen.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

In this section:

- [Step 1: Add Map](#)  1797
- [Step 2: Add Map Items](#)  1798
- [Step 3: View and Share](#)  1798

#### Step 1: Add Map

Click on the **Add Map** button. An assistant is shown. Enter a **Map Name** and define **Map Layout** settings (size and optionally a background image). in the **Public Access** section, define whether your map will be visible without login.

For detailed information, see [Maps Other Settings](#)  1806 section (Settings).

Add Maps Assistant Step 1

## Step 2: Add Map Items

Click on the **Continue to step 2** button to open the **Map Designer**. **Drag&drop** an object from the items list on the right side, define further properties of the item (mark it in the main window of the map designer and see section **Properties** on the right), and confirm. The item will be added immediately. Repeat this procedure as often as you wish until you have added all desired items to the map. Drag items to change their position. Additionally, you can also draw connection lines between items or edit existing items.

For detailed information, see [Maps Designer](#) <sup>1800</sup> section.

## Step 3: View and Share

Click on the **View Map** tab to see the appearance of your map. Later, it will be shown the way you see it there. If available for an object, most object names as well as all sensors can be clicked on. It depends on the object's access rights and the currently logged in user account if clicking the links will lead to more detailed information about the object or to an error message indicating insufficient access rights.

Click on the **Get HTML** tab to get the direct URL of your map that you can share with others. For detailed information, see [Maps Other Settings](#) <sup>1808</sup> section.

While showing a map, the single map items will be refreshed in the refresh interval defined for this map.

## 7.10.2 Maps Designer

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

In this section:

- [Use a Proper Browser](#) 
- [Basic Design Concept](#) 
- [Device Tree Selection](#) 
- [Properties Selection](#) 
- [Edit Existing Map Items—Properties Box](#) 
- [Edit Existing Map Items—Hover Icons](#) 
- [Edit Existing Map Items—Using Cursor Keys](#) 
- [Draw Connection Lines Between Items](#) 
- [Snap To Grid](#) 
- [More](#) 

### Use a Proper Browser

Due to the map designer's extensive scripting capability, it is important that you use a compatible browser when editing maps. We recommend using Google Chrome 34 or later (recommended) or Mozilla Firefox 28 or later. You can use Microsoft Internet Explorer 10 or 11 as well. The maps designer is **not** fully compatible with earlier versions of Internet Explorer or Opera browsers.

### Basic Design Concept

Click on the **Map Designer** tab to open the editor. It might take a few moments to load (for **unresponsive script** warnings, please see [More](#)  section below). Here, you can create your map by adding or changing items. The designer screen consists of three main parts: The **Device Tree** on the left side, the current **Map** in the middle, and the **Properties** on the right side.

Each map item takes attributes from both selections.

- **Device Tree** (left): Select the monitoring object which's data will be shown on the map
- **Properties** (right): Define how the map item will be shown

Simply **drag and drop** any object from either side onto the map, or **double-click** on an object. You will always see all changes immediately.

## Device Tree Selection

Use the **Device Tree** to select the monitoring object which's data will be shown on the map (this can be a probe, a group, a device, or a single sensor). In order to find the right object, you have the following options:

- Use the arrow symbols at the beginning of each line to open nodes in the device tree to show objects underneath probes, groups, and devices.
- Enter a few characters into the **Search** box in the upper left corner to search for names (or part of names) of objects in your configuration. The search results will be shown immediately. Click on the red x icon to clear your search.

No matter which method you choose to find the desired object, you can always drag any object from the **Device Tree** on a free area of the map to create a new map item. If you drag it onto an existing map item, it will be replaced, while **Properties** and size will remain. You can also select a map item and double click on a **Device Tree** object to replace the map item. If no item is selected, a double-click on an object will add a new map item.

To gain more space for map editing, reduce the size of the **Device Tree** box by dragging its right border to left (or to the right to enlarge it again).

## Properties Selection

Use the **Properties** selection to define how the map item will be shown (for example, as an icon, a map, a table, or a graph). Select the appearance in different categories. Hover a property object to get a live preview of it (in most cases). **Note:** If a certain **Properties** object is not available for the selected **Device Tree** object, you will see a corresponding text hint.

There are many different property object types available. Simply click a category's name to show all available types.

- **Icons A, Icons B, Icons C**

These three categories offer a variety of iconic symbols of typical network devices. Below each icon the object name and a sensor overview for the object is shown. This shows how many sensors are in which state. For some sensors, a mini graph is shown as well.

- **Icons A (Static), Icons B (Static), Icons C (Static)**

These three categories offer the same variety of iconic symbols of typical network devices as the category described above. Here, no object data displayed with them, but only the icon is shown.

- **Static Maps**

This category offers free or public domain geographical maps from different sources. For additional geographical maps, please see [More](#)<sup>1804</sup> section below. **Note:** The items in this section are independent from the selected **Device Tree** objects.

- **Status Icons**

This category shows options to insert status icons in different styles. These show the object name and an overview of how many sensors are in which state. There is also an object available for audible alert which will play a sound when the number of alarms of the monitored object are > 0. Please note that your browser must support playing embedded sounds (see [More](#)<sup>1804</sup> section below for further information).

- **Geo Maps**

In this category you can choose from different geographical map styles from Google: road map, satellite, hybrid, and terrain maps. The location of the currently selected object in the **Device Tree** will be shown on the map as a pin mark. To use this feature, Geo Maps integration must be enabled and you have to enter a **Location** in the settings of the monitoring object you want to use this with. For more information, please see [Geo Maps](#)<sup>1744</sup> section. **Note:** If Geo Maps integration is disabled, you will only see white boxes instead of map previews.

- **Graphs**

This category offers different graph styles in several dimensions and detail. You can also select graphs including a legend or sensor states.

- **Objects**

Add some simple geometric shapes to your map. The items shown in this tab are always the same; the range displayed does not depend on the selected object in the **Object** field above.

- **Data Tables**

Choose from several tables showing sensor lists for the current selected object. You can also choose from several lists showing sensors in a certain state only.

- **Top 10**

Choose from several tables showing the top 10 of sensors with certain monitoring data, such as least used CPUs, highest bandwidth usage, best availability, slowest websites, etc.

**Note:** In order to provide live previews, PRTG calculates all top 10 lists from your monitoring data when opening this tab. It may take a few seconds before thumbnails are shown.

- **Custom HTML**

This can be used, for example, to add external images or applets to your map. In order to actually add custom HTML code to your map, please add this item and then click on it to [edit](#) . You can then copy your custom code into the **HTML Before** and **HTML After** fields in the **Properties** box on the right side.

No matter which object you choose, you can always drag any object from the **Properties** box on a free area of the map to create a new map item. If you drag it onto an existing map item, it will be replaced, while its **Device Tree** object attributes and size will remain. You can also select a map item and double click on an object in the **Properties** box to replace the map item. If no item is selected, a double-click on an object will add a new map item.

To gain more space for map editing, reduce the size of the **Properties** box by dragging its left border to right (or to the left to enlarge it again).

## Edit Existing Map Items—Properties Box

Click on a map item to select it. You can then edit its attributes with the fields in the upper part of the **Properties** box on the right side:

- **Top, Left, Width, and Height** fields

Enter position and size values for direct positioning. Click the **Save** button to save your settings. Alternative: Use the mouse to move and resize a map item.

- **Layer** field

The layer number defines if an item will be shown on top of or behind another item, if overlapping. The item with the higher number will be shown on top. Enter a positive integer value and click the **Save** button to save your settings. Alternative: Use the arrow symbols in a map item's hover menu to **Bring to front** or **Send to back** an item one layer (see below).

- **HTML**

Click on the arrow symbol underneath to show the **HTML Before** and **HTML After** fields. Any HTML code you enter in these fields will be added before respectively after the map item. Please enter your custom HTML code that embeds an object and click the **Save** button. Your HTML object will be inserted. For example, you could enter the code `` to insert an image of the Paessler logo from the Paessler website.

## Edit Existing Map Items—Hover Icons

Hover a map item to show the edit icons for it.

- **Bring to front (arrow up symbol)**

Move this item one layer to the front. This is useful when adding several items to a map that overlap each other.

- **Send to back (arrow down symbol)**  
Move this item one layer to the back. This is useful when adding several items to a map that overlap each other.
- **Delete (trash symbol)**  
Delete this item. **Note:** Be careful! The item will be deleted immediately without notice and you cannot undo this. Alternative: Select the item and press the **Del** button on your keyboard.
- **Drop Connections (scissors symbol)**  
If you have drawn connection lines between two items, you can delete all lines starting from this item. Connection lines will be dropped immediately. **Note:** If a line between two items is not dropped, you've probably drawn it starting from the other item. Try the scissors symbol on the other item instead.

## Edit Existing Map Items—Using Cursor Keys

While an object is selected, use the cursor keys to move it by one pixel. Hold the **Shift** key in combination with the cursor keys to move the object by 10 pixels.

## Draw Connection Lines Between Items

You can draw connection lines between any map items via drag and drop. Simply click on the grey handles next to an item and drag a line to another item you want to draw a connection to. A line will be shown immediately. This can be useful to indicate network connections or logical coherences between two items. To delete connection lines, click the scissors symbol in the item's [edit icons](#) .

Lines between objects are colored dynamically. They will turn red as long as one of the object's icons shows a red **Down** status. This will only affect half of the line, at the end where the red sensor is shown. If both objects connected show a red sensor, this will result in a line that is red all over.

## Snap to Grid

Select whether to use **Snap To Grid** or **Don't Snap**, using the buttons underneath the **Device Tree** box. This will affect how map items will be positioned when adding or moving them via drag and drop. The setting is active immediately. With snap to grid enabled, you can place items aligned with the grid only.

### 7.10.3 Maps Settings

Using the Map tabs you can access all functionalities and settings for a map.

#### View Map

Click on the **View Map** tab any time to show a preview of your map.

#### Map Designer

Click on the Map Designer tab to edit the contents of your map. Please see [Maps Designer](#) <sup>1800</sup> section.

#### Settings

Click on the **Settings** tab to open a map's general settings. **Note:** When using the **Add Map** dialog, not all of these settings are available. You can change them later by clicking on the **Settings** tab.

Basic Map Settings	
Map Name	Enter a meaningful name for the map.
Security Context	Define the user account that will be used for access to monitoring data. The map will only contain objects which the selected <a href="#">user</a> <sup>94</sup> is allowed to view. Please choose a user from the list. The available users depend on your configuration. By default, this is the user that created the map. PRTG Administrator users can change this setting.
Timezone	Define the time zone that will be used for all date-specific options in this map. Select a time zone from the list.
Tag Filter	This setting affects table maps objects. Enter one or more tags separated by space or comma to include sensors in tables. Only sensors with one of the tags entered here will appear in this map's data tables—including sensors which <a href="#">inherit</a> <sup>87</sup> tags from parent objects. Please enter a string or leave the field empty. <b>Note: Use with care!</b> This setting will affect all tables of the current map!

Map Layout	
Map Width	Define the width of the map in pixels. Please enter an integer value.
Map Height	Define the height of the map in pixels. Please enter an integer value.
Background Picture	<p>Define if you want to use a background picture for the map. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>On:</b> Use a background image (define below).</li> <li>▪ <b>Off:</b> Do not use a background image.</li> </ul>
Background Image	<p>This option is only visible if a background picture is enabled above. Click on the <b>Choose File</b> button and select an image from your computer or network. <b>Note:</b> Only images in the format JPG, PNG, and GIF are supported. The file size must be smaller than 2 MB. If you try to upload other images, you will get an error message. In a cluster, background images are not automatically deployed to the other nodes! In order to view maps on other nodes, please copy the background pictures manually to <code>\webroot\mapbackground</code> of the program directory on every node. For detailed information on how to find this path, please see <a href="#">Data Storage</a> <sup>2074</sup> section.</p>
Background Color	Select a background color for this Map. Either enter a hex color code or choose a color from the color selector. The hex color code field will always display the currently defined color.
Public Access	
Public Access	<p>Define if others can see the map. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No Public Access:</b> Do not allow public access to the map. Only users with both a login to the PRTG web interface and sufficient access rights can see the map.</li> <li>▪ <b>Allow Public Access:</b> Allow access to the map using a unique address. The URL contains a key that you can change below.</li> </ul>
Secret Key	<p>This field is only visible if public access is enabled above. The key is automatically generated. It is part of the public URL for the map. You can also enter a customized string. We recommend using the default value. For more information on public access, please see the <a href="#">Get HTML</a> <sup>1808</sup> section. <b>Note:</b> The characters comma "," and colon ":" are not allowed in the secret key field!</p>

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its settings.</li> <li>▪ <b>Write:</b> Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, as well as review and edit its settings and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings.</p>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Get HTML

Your PRTG map is like a standalone HTML page. You can make it accessible to others, if you like. Depending on the **Public Access setting** of your map, a visitor will need to provide PRTG user account login data to view the map, or will see the map immediately using a URL containing a secret key. When using this unique key, you can also include your map on another webpage, embedding it via `<iframe>`.

- **Option 1: Link to a web page with the map that requires login credentials**  
The shown URL requires login credentials in order to display the map. PRTG will ask the user trying to view the map via this URL for login credentials. **Note:** In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize URL you use for access to your needs.
- **Option 2: Link to a web page that displays the map without a login**  
In order to get the shown URL working for public access without a login, enable **Allow Public Access** in the **settings tab** of your map. **Note:** In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize URL you use for access to your needs.

- **Option 3: Show a map inside other web pages using an IFRAME**

For your convenience, this shows source code for adding an **iframe** to another webpage. It includes a URL for direct access. Just copy the code and paste it into your webpage's code. Also enable **Allow Public Access** in the [settings tab](#)<sup>1806</sup>. **Note:** In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize URL you use for access to your needs.

While a map is shown via these URLs, you can change the refresh interval any time by hovering the arrows symbol in the lower right corner. Choose between **10**, **30**, or **60** seconds, **10** minutes or **Refresh** now.

## Comments

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

## History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the PRTG user which conducted the change, and a message. The history log keeps the last 100 entries.

## Delete

You can delete the entire map any time by clicking on the trash symbol on the right.

## More

Knowledge Base: How to disable links in public maps?

- <http://kb.paessler.com/en/topic/10283>
- [Data Reporting](#)<sup>931</sup>

## 7.11 Setup

In the setup settings of the PRTG web interface, you can define almost all system settings for PRTG. However, some of the machine-oriented settings are defined using two Windows administration tools (see [Others](#)<sup>1811</sup> section below).

In the main menu, click on **Setup** to show the available options.

**Setup Overview Page**

### Account Settings

- [Account Settings—My Account](#)<sup>1812</sup>
- [Account Settings—Notifications](#)<sup>1817</sup>
- [Account Settings—Schedules](#)<sup>1827</sup>

### System Administration

- [System Administration—User Interface](#)<sup>1831</sup>
- [System Administration—Monitoring](#)<sup>1839</sup>
- [System Administration—Notification Delivery](#)<sup>1843</sup>

- [System Administration—Core & Probes](#)  1849
- [System Administration—Cluster](#)  1855
- [System Administration—User Accounts](#)  1855

- [Chrome Desktop Notifications](#)  1887

## Support

- [Support—Contact Support](#)  1889

## Others

There are some settings that have to be made in the [System Administration Tools](#)  1998, running as Windows applications. For more details, please see sections:

- [PRTG Server Administrator](#)  1999
- [PRTG Probe Administrator](#)  2016

### 7.11.1 Account Settings—My Account

In the **My Account** settings you can define values regarding your own PRTG user currently logged in. All settings in this section are user specific. Some account control options may not be available, but can only be defined by the administrator.

**Account Settings**

**My Account** | Notifications | Schedules

**USER ACCOUNT**

Login Name: prtgadmin

Display Name: PRTG System Administrator

Email Address: john.q.public@paessler.com

Timezone: (UTC+01:00) Amsterdam, Berlin, Bern, Rom, Stockholm, Wien

Date Format: Use System Settings

Password: ☒ Don't change ☐ Specify new password

Hash:

**AUTO REFRESH AND ALERTING**

Auto Refresh Type: ☒ Refresh page elements using AJAX (recommended) ☐ Refresh whole page ☐ No auto refresh

Auto Refresh Interval (sec): 600

Play Audible Alarms: ☒ Never ☐ On dashboard pages only ☐ On all pages

Tickets as Emails: ☒ Yes ☐ No

**WEB INTERFACE**

Homepage URL: /welcome.htm

Max. Groups/Devices per Group: 10

Max. Sensors per Device: 20

**Save** **Cancel**

My Account Settings

[Follow & Share](#) [Contact Support](#) [Help](#)

## My Account Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

User Account	
Login Name	Enter the login name for the user.
Display Name	Enter a name for the user for display purposes. This will not be used for login.

User Account	
Email Address	Enter the user's email address.
Timezone	Enter the time zone for the current user.
Date Format	Enter in what format dates will be displayed for the current user. <b>Note:</b> This setting will take effect after the next login.
Password	<p>Define the user's password. For security reasons, the account settings page does not contain the password. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't change</b></li> <li>▪ <b>Specify new password</b></li> </ul> <p>If you choose to specify a new password, enter the old password, and the new password twice.</p> <p><b>Note:</b> The new password must be at least 8 characters long; no character may occur more than 3 times. It must contain a number and a capital letter.</p>
Hash	<p>The hash (passhash) value can be used as password substitute when calling functions from PRTG's Application Programming Interface (API) that require an authentication. For more information please see <a href="#">Using the PRTG API (Application Programming Interface)</a> section.</p>

Auto Refresh and Alerting	
Auto Refresh Type	<p>Specify how PRTG's web pages will be refreshed for the current user. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Refresh page elements using AJAX (recommended):</b> Automatically refresh the single page elements on the web pages.</li> <li>▪ <b>Refresh whole page:</b> Automatically reload the whole page with every refresh interval.</li> <li>▪ <b>No auto refresh:</b> Do not automatically refresh web pages.</li> </ul>
Auto Refresh Interval (Sec.)	<p>This setting is only relevant when auto refresh is enabled above. Enter the number of seconds that will be waited between two refreshes. We recommend using 30 seconds or more. Minimum value is 20 seconds. <b>Note:</b> Shorter intervals create more CPU load on the server running the PRTG core server. If you experience load problems while using the web interface (or PRTG <a href="#">maps</a> <sup>1794</sup>), please set a higher interval.</p>

### Auto Refresh and Alerting

#### Play Audible Alarms

Define when an audible alarm will be played for the current user on web pages whenever there are [alarms](#)<sup>144</sup> in PRTG. Choose between:

- **Never:** Do not play sound files on any web pages.
- **On dashboard pages only:** When there are alarms, play a predefined sound on [dashboard](#)<sup>175</sup> pages only. The sound will be replayed with every refresh of a dashboard page.
- **On all pages:** When there are alarms, play a predefined sound on all web pages. The sound will be replayed with every page refresh.

For more information about audible notifications and supported browsers, please see [More](#)<sup>1816</sup> section below.

### Ticket System

#### Email Notifications

Define if you want to get emails from the ticket system. Choose between:

- **I want to receive an email whenever a ticket changes:** You will receive an email each time a ticket is assigned to you or your user group, or if a ticket which is assigned to you or your user group is changed. **Note:** If you edit tickets which are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email.
- **I do not want to receive any emails from the ticket system:** You will not get any emails about tickets.

### Web Interface

#### Homepage URL

Define the user's default page loaded after login and when clicking on the [Home](#)<sup>175</sup> button in main menu.

#### Max. Groups/Devices per Group

In order to provide you with a speedy user experience PRTG tries to keep the page size for the page showing the device tree small by automatically folding groups and devices with many items. Define how many groups and devices are shown at maximum before the automatic reduction is performed. We recommend using a value between **10** and **30**.

Web Interface	
Max. Sensors per Device	In order to provide you with a speedy user experience PRTG tries to keep the page size for the page showing the device tree small by automatically folding groups and devices with many items. Define how many sensors are shown at maximum before the automatic reduction is performed. We recommend using a value between <b>10</b> and <b>30</b> .
Account Control	
Account Type	<p>This setting is only shown for administrator users. However, it is not shown if the user you modify the account settings for is a member of a group with administrative rights.</p> <p>Define the account type for the current user. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Read/Write User:</b> The user may change settings.</li> <li>▪ <b>Read Only User:</b> The user may not edit any settings. This is a good choice for public or semi-public logins.</li> </ul> <p><b>Note:</b> This setting cannot be changed for the default administrator user.</p>
Allow Acknowledge Alarms	<p>This setting is only visible if read only user is enabled above. Acknowledging an alarm is an action which requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may <a href="#">acknowledge alarms</a><sup>[145]</sup>. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Allow:</b> Allow acknowledging alarms for this user.</li> <li>▪ <b>Deny:</b> The user will not be able to acknowledge alarms.</li> </ul>
Primary Group	<p>This setting is only shown for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience, there is no difference between the primary and other user groups.</p>
Status	<p>This setting is only shown for administrator users. Define the status of the current user. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Active:</b> The current user can login to the account.</li> <li>▪ <b>Inactive:</b> The current user's login is disabled. Use this option to temporarily deny access for this user.</li> </ul> <p><b>Note:</b> This setting cannot be changed for the default administrator user.</p>

**Account Control****Last Login**

Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.

**User Groups****Member of**

Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.

**Comments**

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

**History**

In the **History** tab all changes in the settings of an object are logged with a timestamp, the PRTG user which conducted the change, and a message. The history log keeps the last 100 entries.

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

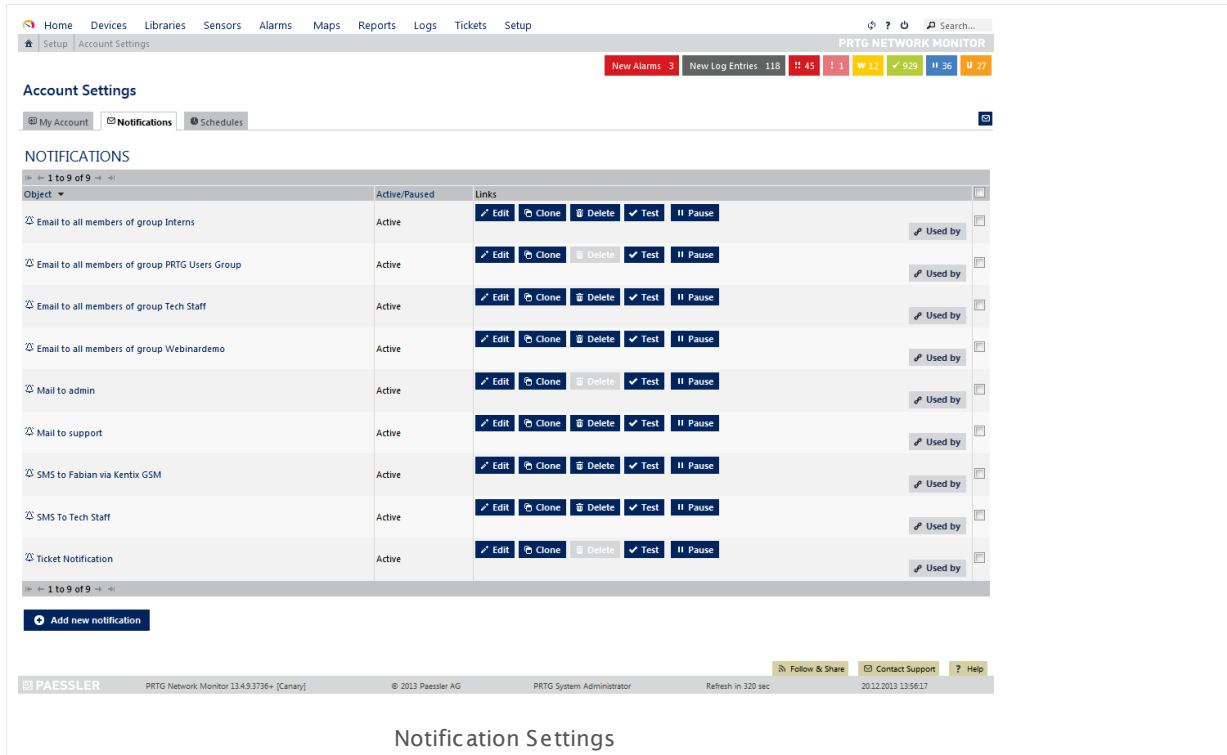

**More**

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- <http://kb.paessler.com/en/topic/26303>

## 7.11.2 Account Settings—Notifications

In the notifications settings you can define and change notifications for the currently logged in PRTG user. They can be triggered for certain sensor states and data.

The screenshot displays the 'Account Settings' page in PRTG Network Monitor, specifically the 'Notifications' tab. The page features a navigation bar at the top with links to Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below the navigation bar, there's a status bar showing 'New Alarms: 3', 'New Log Entries: 118', and various status indicators. The main content area is titled 'NOTIFICATIONS' and contains a table with the following columns: Object, Active/Paused, Links, and Used by. The table lists 9 notifications, all of which are 'Active'. Each notification has a 'Used by' button. Below the table, there is an 'Add new notification' button. The footer of the page includes the PAESSLER logo, the PRTG Network Monitor version (13.4.3.3736), and copyright information (© 2013 Paessler AG).

Object	Active/Paused	Links	Used by
Email to all members of group Interns	Active	Edit, Clone, Delete, Test, Pause	Used by
Email to all members of group PRTG Users Group	Active	Edit, Clone, Delete, Test, Pause	Used by
Email to all members of group Tech Staff	Active	Edit, Clone, Delete, Test, Pause	Used by
Email to all members of group Webinardemo	Active	Edit, Clone, Delete, Test, Pause	Used by
Mail to admin	Active	Edit, Clone, Delete, Test, Pause	Used by
Mail to support	Active	Edit, Clone, Delete, Test, Pause	Used by
SMS to Fabian via Kentix GSM	Active	Edit, Clone, Delete, Test, Pause	Used by
SMS To Tech Staff	Active	Edit, Clone, Delete, Test, Pause	Used by
Ticket Notification	Active	Edit, Clone, Delete, Test, Pause	Used by

### Note

This section describes one of three steps to set up the notification system in PRTG. A complete notification setup involves:

1. Check and set up the **Notification Delivery** settings. This will tell PRTG how to send messages.  
For detailed information, see [System Administration—Notification Delivery](#)<sup>1843</sup>.
2. Check and set up several **Notifications**. This will define the kind of message and its content.  
For detailed information, see [Account Settings—Notifications](#)<sup>1817</sup>.
3. Check and set up **Notification Triggers** for objects. These will provoke the defined notifications.  
For detailed information, see [Sensor Notifications Settings](#)<sup>1716</sup>.

For background information, please see [Notifications](#)<sup>1749</sup> section.

## Notifications Overview

Click on the **Notifications** tab to show a list of all existing notifications. Using the links next to the notification name, you can perform the following actions:

- **Delete:** Delete this notification (not possible for predefined notifications)
- **Test:** Trigger this notification immediately for testing purposes. **Note:** When using placeholders, they will not be resolved in a test notification, but the variables will be sent instead.
- **Pause:** Pause this notification. If a notification is paused, no messages will be sent when it is triggered.
- **Clone:** Create an exact copy of this notification. It will be added to the notifications list as **Clone of ...**
- **Used by:** Show a list of objects using this notification.

Please see also [Working with Table Lists](#)<sup>[156]</sup>. Additionally, there is multi-edit available. This enables you to change properties of several objects at a time. For more details, please see [Multi-Edit Lists](#)<sup>[1736]</sup> section.

## Notifications Settings

Click on the **Add new notification** button to add a new notification, or click on the name of an existing notification to edit it.

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Basic Notification Settings	
Notification Name	Enter a meaningful name for the notification, for example, <b>SMS to service team</b> or similar.
Status	Select the status of the notification. Choose between: <ul style="list-style-type: none"><li>▪ <b>Started:</b> This notification will be active.</li><li>▪ <b>Paused:</b> Pause this notification. If a notification is paused, no messages will be sent when it is triggered.</li></ul>

**Basic Notification Settings**

Schedule	Define when this notification will be active. Please select <b>None</b> to set it to always active, or choose a schedule from the list. Usually schedules define when this notification will be active; schedules defined as period list set this notification to <b>inactive</b> at the corresponding time spans. The available options depend on your setup. To add or change existing schedules, please see <a href="#">Account Settings—Schedules</a> section.
Postpone	Define if notifications triggered during <b>Pause</b> status will be sent later on. <ul style="list-style-type: none"> <li>▪ <b>No</b>: Discard all notification triggers received while the notification is paused.</li> <li>▪ <b>Yes</b>: Collect all notification triggers received while the notification is paused. Send out notifications once the pause status ends.</li> </ul>

**Notification Summarization**

Method	Define if and how notifications will be summarized if several notification triggers are received in a certain time span. <b>Note</b> : Regardless of the option chosen here, notifications of <b>Execute HTTP Action</b> and <b>Execute Program</b> are always sent ASAP; they are never summarized. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Always notify ASAP</b>: Always send out one notification for each notification trigger received.</li> <li>▪ <b>Send first DOWN message ASAP, summarize others</b>: When receiving several <b>Down</b> triggers, send the first notification immediately, but summarize other notifications into one message.</li> <li>▪ <b>Send first DOWN and UP message ASAP, summarize others</b>: When receiving several <b>Down</b> or <b>Up</b> triggers, send each first notification immediately, but summarize other notifications into one message.</li> <li>▪ <b>Send all DOWN messages ASAP, summarize others</b>: When receiving several <b>Down</b> triggers, send out one notification for each trigger received, but summarize notifications for all other triggers into one message.</li> <li>▪ <b>Send all DOWN and UP messages ASAP, summarize others</b>: When receiving several <b>Down</b> or <b>Up</b> triggers, send out one notification for each trigger received, but summarize notifications for all other triggers into one message.</li> <li>▪ <b>Always summarize notifications</b>: When receiving several notification triggers, summarize all notifications into one message, regardless of the kind of trigger received.</li> </ul>
--------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Notification Summarization	
Subject for Summarized Messages	Define a subject which will be used when sending summarized notifications. You can use the placeholder <b>%SUMMARYCOUNT</b> for the number of messages which are summarized. <b>Note:</b> The subject you define is only used for <b>Send Email</b> and <b>Amazon Simple Notification Service Message</b> notifications.
Gather Notifications For (Minutes)	Define a time span in minutes for which notifications will be collected for summarization. Please enter an integer value. <b>Note:</b> If you define a high value, for example, <b>60</b> minutes, PRTG will send out summarized notifications with a delay of up to one hour.

Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited:</b> Use the settings of the parent object.</li> <li>▪ <b>None:</b> Users in this group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ <b>Read:</b> Users in this group can see the object and review its settings.</li> <li>▪ <b>Write:</b> Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.</li> <li>▪ <b>Full:</b> Users in this group can see the object, as well as review and edit its settings and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a> settings.</p>

## Notifications Settings—Choose Notification Methods

With the following settings, you can add one or more methods by which a notification message will be sent out. From the list you can only choose one method or combine several methods. Whenever the notification is triggered, it will send out messages or perform actions for all configured methods at a time.

To choose a method, add a check mark symbol in front of the respective setting name. You will then see the options as described below.

**Note:** In your message, you can use various placeholders. Some are already filled in by default. For a complete list of available placeholders, please see the [More](#) section below.

**Send Email**

**Note:** The email **header** and **footer** can be set in the [System Administration—Notification Delivery](#) settings.

Email Address	Enter one or more recipient email addresses. If entering more addresses, separate them by comma. If you want to send to a PRTG user group only, leave this field empty!
Send to User Group	<p>From the drop down list, please choose a user group to send an email with the report to all members of this group (you can edit user groups under <a href="#">System Administration—User Groups</a>). Select <b>None</b> to not use this feature.</p> <p><b>Note:</b> If you define individual email addresses (see field above) and a user group, the message will be sent to the individual email addresses as well as to the members of the selected user group. In both cases, PRTG will send one message with all recipients in the "To" field of the email.</p>
Subject	Enter the subject of the email. Several placeholders (variables) are used here by default.
Format	<p>Define the kind of email that will be sent. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Text</b></li> <li>▪ <b>HTML</b></li> </ul>
Message	Depending on the format option selected above, you will see a text or HTML message in this field. A complete message about the sensor status is already predefined. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else). Click on the <b>Reset to default</b> link underneath the text box to do so.
Priority	Define the priority which will be set in the email. Some email clients can show this flag.

**Add Entry to Event Log**

Logfile	<p>Define the log file the message will be written to. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Application:</b> Use the Windows application log file in the event log.</li> <li>▪ <b>PRTG Network Monitor:</b> Write messages to the PRTG Network Monitor log file in the Windows event log.</li> </ul>
---------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Add Entry to Event Log**

Event Source	This setting is only relevant when using the <b>Application</b> log file. Enter the source for the event. Usually, this is the name of the application.
Event Type	Select the type of the event. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Error</b></li> <li>▪ <b>Warning</b></li> <li>▪ <b>Information</b></li> </ul>
Event Log Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

**Send Syslog Message**

Host/IP	Define the IP address or DNS name of the computer running the syslog server.
Port	Enter the port number on which syslog messages are sent. By default, this is port number 514. <b>Note:</b> Only User Datagram Protocol (UDP) is supported.
Facility	Define the facility information. There are several options available from the list.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

**Send Syslog Message—Syslog Message Severity Status**

Depending on the status of the sensor triggering the syslog notification the **Severity** level of the message will be set automatically:

 OK	Severity level: Notice (5)
 Warning	Severity level: Warning (4)

**Send Syslog Message—Syslog Message Severity Status**

 Error	Severity level: Error (3)
-----------------------------------------------------------------------------------------	---------------------------

**Send SNMP Trap**

For information about the OIDs used in the contents of the traps sent by PRTG, please see the SNMP Trap documentation in the [More](#) <sup>1820</sup> section below.

Host/IP	Define the IP address or DNS name of the computer running the trap receiver.
SNMP Port	Enter the port number on which trap messages are sent. By default, this is port number <b>162</b> .
Community String	Enter the device's community string. By default, this is set to <b>public</b> . Please enter a string or leave the field empty.
Specific Trap Code	Enter a code that can help you identify the purpose of the trap. Default value is <b>0</b> . Please enter an integer value.
Message ID	This ID helps you identify the origin of the trap. For example, enter <b>1.3.6.1.4.1.32446.1.1.1</b>
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).
Agent IP	Define the IP address of the agent. Leave this field blank to use the PRTG web server's IP address.

**Send SMS/Pager Message**

**Note:** This notification method needs to be set up in the [System Administration—Notification Delivery](#) <sup>1843</sup> settings first.

**Note:** This notification method will use the central proxy settings defined for your PRTG core server. For details, please see [System Administration—Core & Probes](#) <sup>1049</sup> (section **Proxy Configuration**).

**Send SMS/Pager Message**

Recipient Number	Define the number the message will be sent to. The format depends on the SMS provider. Usually, you will use a plus sign, followed by country code and number. For example, enter <b>+1555012345</b> .
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

**Execute HTTP Action**

**Note:** Regardless of the **Notification Summarization** method chosen above, notifications of **Execute HTTP Action** are always sent as soon as possible (ASAP); they are never summarized.

**Note:** This notification method will use the central proxy settings defined for your PRTG core server. For details, please see [System Administration—Core & Probes](#)<sup>1849</sup> (section **Proxy Configuration**).

URL	Enter the URL the request will be sent to.
Postdata	If you want to send postdata to the URL, please enter it here. You can use placeholders here. Line breaks are supported.

**Execute Program**

**Note:** Regardless of the **Notification Summarization** method chosen above, notifications of **Execute Program** are always sent as soon as possible (ASAP); they are never summarized.

Program file	<p>Select an executable file from the list. It will be run every time the notification is triggered. In this list, files in the corresponding / <b>Notifications/EXE</b> sub-directory of the probe system's PRTG installation are shown. In order for the files to appear in this list, please store them as BAT, CMD, DLL, EXE, PS1, or VBS. In order to find the corresponding path, please see <a href="#">Data Storage</a><sup>2074</sup> section.</p> <p><b>Note:</b> In a cluster setup, please copy your files to every cluster node installation manually. This makes sure the notification can be executed even when the master node fails. If your custom notification executes an external program, this has to be installed on all cluster nodes as well. Please see also <a href="#">Application Programming Interface (API) Definition</a><sup>2031</sup> for detailed information.</p>
--------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Execute Program**

Parameter

Enter parameters with which the program file will be started. You can use placeholders here. For example, when using a batch file containing a %1 variable, you can provide a value for this variable here.

**Send Amazon Simple Notification Service Message**

AWS Access Key ID

Enter your access key as shown in your login area at aws.amazon.com. Please enter a string.

AWS Secret Access Key

Enter your secret access key as shown in your login area at aws.amazon.com. Please enter a string.

Location

Define the location of your Amazon service. Choose between:

- **US-East**
- **US-West**
- **EU-West**

ARN

Enter the Amazon resource name. Please enter a string.

Subject

Enter the subject of the message.

Message

Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol \* (and nothing else).

**Assign Ticket**

**Note:** Regardless of the **Notification Summarization** method chosen above, notifications of **Assign Ticket** are always sent as soon as possible (ASAP); they are never summarized.

For details about the ticket system, please see section [Tickets](#) <sup>149</sup>.

Assign to User or User Group

Specify whether to assign the notification ticket to a user group or to a single user. Choose between:

- **To User Group:** Define the user group which will get this ticket below.
- **To User:** Define the dedicated user who will get this ticket below.

Assign Ticket	
Assign Ticket to this User Group / User	Select the user group resp. user to which the notification ticket will be assigned to from the drop down menu.
Subject	Enter the subject of the ticket. Several placeholders (variables) are used here by default. You can change it to your liking.
Content	Define the message in the ticket. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking.
Close Ticket when Condition Clears	Specify if you want to have the ticket automatically closed when the defined trigger condition clears. Choose between: <ul style="list-style-type: none"> <li>▪ <b>Yes:</b> The ticket will be closed automatically.</li> <li>▪ <b>No:</b> The ticket will remain open after the condition has cleared.</li> </ul>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Others

For information about the comments and history tabs, please see [Object Settings](#)<sup>142</sup> section.

### 7.11.3 Account Settings—Schedules

In the schedules settings you can define and change schedules for the currently logged in user. You can use schedules to [pause](#)<sup>162</sup> monitoring/notify at certain times with the period lists option, respectively activate it at certain times with the time table option. You can also use schedules to define the time spans that are to be covered when creating [reports](#)<sup>1775</sup>.

The screenshot displays the 'Account Settings' page in PRTG Network Monitor, specifically the 'Schedules' tab. The page header includes navigation links like Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. A status bar at the top right shows 'New Alarms: 3', 'New Log Entries: 118', and various status icons. The main content area is titled 'SCHEDULES' and shows a list of 8 predefined schedules. Each schedule row includes an 'Object' column with a calendar icon, a 'Links' column with 'Edit' and 'Delete' buttons, and a 'Used by' column with a 'Used by' button. The schedules are: Saturdays [GMT+0200], Sundays [GMT+0200], Weekdays [GMT+0200], Weekdays Eight-To-Eight (8:00 - 20:00) [GMT+0200], Weekdays Nights (17:00 - 9:00) [GMT+0200], Weekdays Nights (20:00 - 8:00) [GMT+0200], Weekdays Nine-To-Five (9:00 - 17:00) [GMT+0200], and Weekends [GMT+0200]. At the bottom of the list is an 'Add new schedule' button. The footer of the page includes the PAESSLER logo, version information (PRTG Network Monitor 13.4.9.3736+ [Canary]), copyright (© 2013 Paessler AG), user role (PRTG System Administrator), refresh interval (Refresh in 202 sec), and contact information (Contact Support, Help).

### Schedules Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Click on the **Schedules** tab to show a list of all existing schedules. Using the links next to the notification name, you can perform the following actions:

- **Delete:** Delete this notification (not possible for predefined notifications)
- **Used by:** Show a list of objects using this notification.

Please see also [Working with Table Lists](#)<sup>156</sup>. Additionally, there is multi-edit available. This enables you to change properties of several objects at a time. For more details, please see [Multi-Edit Lists](#)<sup>1736</sup> section.

Click on the **Add new schedule** button or click on the name of an existing notification to edit.

Edit Schedule Time Table

## Basic Settings

Schedule Name	Enter a meaningful name for the schedule that describes the defined time span(s) or purpose.
Edit Mode	<p>Select how you want to define a schedule. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use weekday/hour time table:</b> Define a schedule with available checkboxes. Lowest increment is one hour. <b>Note:</b> The time table defines <b>active</b> time slots.</li> <li>▪ <b>Use list of period definitions:</b> Define a schedule by entering text lines using a specific syntax (see below). <b>Note:</b> The period list defines <b>inactive</b> time slots.</li> </ul>
Time Table	This selection is only visible if the time table option is enabled above. Define the schedule. It will be used for monitoring objects, reporting, and notifications. You can set time spans with a precision of one hour by setting check marks. If a box is checked, it means the object is active during this hour, if unchecked, the object will be paused during this hour. You can set check marks individually, or change complete ranges for certain days of the week or time spans.

Basic Settings	
	<ul style="list-style-type: none"> <li>▪ To add ranges of check marks, use the buttons <b>All</b>, <b>Mo</b>, <b>Tu</b>, <b>We</b>, <b>Th</b>, <b>Fr</b>, <b>Sa</b>, and <b>Su</b>, as well as the time buttons on the left side.</li> <li>▪ To remove ranges of check marks, use the buttons <b>All Off</b>, <b>Mo Off</b>, <b>Tu Off</b>, <b>We Off</b>, <b>Th Off</b>, <b>Fr Off</b>, <b>Sa Off</b>, and <b>Su Off</b>, as well as the time <b>Off</b> buttons on the right side.</li> </ul>
Period List	<p>This field is only visible if period definitions are enabled above. Define the date/time ranges in which the objects using this schedule will be <b>inactive</b> (i.e., paused). During other times, the objects will be active. Enter the ranges in the format <b>ww:hh:mm-ww:hh:mm</b>. For details and examples, see <a href="#">Schedules Settings—Period Definition Syntax</a><sup>1829</sup> below.</p>
Access Rights	
User Group Access	<p>Define which user group(s) will have access to the object you're editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:</p> <ul style="list-style-type: none"> <li>▪ <b>Inherited</b>: Use the settings of the parent object.</li> <li>▪ <b>None</b>: Users in this group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ <b>Read</b>: Users in this group can see the object and review its settings.</li> <li>▪ <b>Write</b>: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.</li> <li>▪ <b>Full</b>: Users in this group can see the object, as well as review and edit its settings and edit access rights settings.</li> </ul> <p>You can create new user groups in the <a href="#">System Administration—User Groups</a><sup>1861</sup> settings.</p>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Schedules Settings—Period Definition Syntax

Define one or more periods of time during which the object using this schedule will be **inactive**. In each line, enter one range in the format **ww:hh:mm-ww:hh:mm**: weekday, hour, minute.

- **Possible values for ww**: mo, tu, we, th, fr, sa, su.

- **Possible values for hh:** Enter the hour in 24 hours format (no AM/PM allowed), i.e. a number between 00 and 23.
- **Possible values for mm:** Enter the minute, i.e. a number between 00 and 59.

### Example

In the following, find an example of a schedule that pauses an object during the weekend as well as on Wednesday evenings.

```
fr:19:30-mo:06:05  
we:18:45-we:23:00
```

Any object using this schedule will be paused from Friday, 7:30 p.m. to Monday, 6:05 a.m. as well as on Wednesday from 6:45 p.m. to 11 p.m. It will be active during the other times.

### Others

For information about the comments and history tabs, please see [Object Settings](#)<sup>142</sup> section.

### 7.11.4 System Administration—User Interface

In the user interface settings you can define global values regarding the PRTG web site appearance, PRTG web server settings and performance, geo maps, and graph settings.

#### User Interface Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Website	
PRTG Site Name	When using the web interface, the site name is shown in the title bar of your browser window. It is also used by default in notification emails. Please enter a string.
DNS Name	If your PRTG web interface is (additionally) reachable via a DNS name, please enter it here. It is e.g. used by default in notification emails to generate links. Please enter a string.
Website Language	<p>Choose the system language from the drop down menu. Default is <b>English</b>. Depending on your installation, you may be able to choose other languages here. This setting will influence the language of the <a href="#">Ajax</a> <sup>[100]</sup> and the <a href="#">Mobile Web GUI</a> <sup>[1947]</sup> web interfaces, as well as of the PRTG <a href="#">System Administration Tools</a> <sup>[1998]</sup>.</p> <p><b>Note:</b> If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a> <sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a> <sup>[1950]</sup> will be disconnected. After clicking on the <b>Save</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p>
Graph Type	<p>Select how graphs will be displayed throughout the web interface and in <a href="#">reports</a> <sup>[1775]</sup>.</p> <ul style="list-style-type: none"> <li>▪ <b>Use area charts (recommended):</b> Display filled graphs.</li> <li>▪ <b>Use line charts:</b> Display graphs using single lines only.</li> </ul> <p>We recommend using area charts, as they're better to read. <b>Note:</b> Graphs containing data from more than one cluster node will always be displayed with line charts automatically.</p>

Geo Maps	
Map Service Provider	<p>Select if and how you want to integrate the Geo Maps feature into the web interface. If enabled, PRTG uses the first line of the location <a href="#">setting of an object</a><sup>142</sup> to show it on a geographical map. Please choose a map provider:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not show maps (disables Geo Maps integration):</b> Disable Geo Maps integration and do not show geographical maps in the web interface.</li> <li>▪ <b>MapQuest:</b> Use MapQuest to show geographical maps. This is the recommended option.</li> <li>▪ <b>Nokia Maps:</b> Use Nokia Maps to show geographical maps.</li> <li>▪ <b>CloudMade (API key required):</b> Use CloudMade to show geographical maps. Please sign up for an API key on their developer website to use this service.</li> <li>▪ <b>Google Static Maps (API key required):</b> Use Google Static Maps to show geographical maps. Please sign up for a Google Maps API v2 key to use this service. <b>Note:</b> As of PRTG version 13 you will need to acquire a Google Maps <b>API v3</b> key!</li> </ul> <p>For more information about the different map providers, please see the <a href="#">More</a><sup>1838</sup> section below.</p>
Map Type	<p>This setting is only visible for some map providers. Depending on the chosen provider, several options are shown. Each will show map tiles in a different appearance. Please choose a map type from the list.</p>
API Key (required)	<p>This field is only visible if you selected a provider that requires an API key. Please obtain your personal key and paste it here. For more information on how to get an API key, please see the <a href="#">More</a><sup>1838</sup> section below. Please enter an alphanumeric string.</p>

Web Server	
Performance Strategy	<p>Select if you want to enable performance improvements for the web interface.</p> <ul style="list-style-type: none"> <li>▪ <b>All Features: Show all features and live data (recommended):</b> Provide full functionality and show all menu items.</li> </ul>

Web Server	
	<ul style="list-style-type: none"> <li>▪ <b>More Speed: Limit features and delay display (experimental):</b> Improve reaction time and speed of the web interface by delaying display of monitoring data and hiding some features.</li> </ul> <p>For more information on how to speed up the web interface, please see <a href="#">More</a> <small>1838</small> section below.</p>
IP Address for Web Server	<p>PRTG is running a web server in order to provide access via the web and Windows interface. Please specify which IP address this web server will run on. <b>Note:</b> Later, you can log into PRTG by simply pointing your browser to the specified IP address.</p> <p>Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Localhost, 127.0.0.1 (PRTG will not be accessible from other computers):</b> Use <b>127.0.0.1</b> only. PRTG's web and Windows interface will only be accessible from the computer PRTG is installed on. <b>Note:</b> Either the selected port or at least one port in the range from <b>8080</b> to <b>8089</b> has to be available on <b>127.0.0.1</b>.</li> </ul> <p><b>Note:</b> If you run PRTG on localhost, please do not use the DNS name <b>http://localhost</b> to log in to the web server, as this may considerably slow down PRTG's web interface. Please use your local IP address or <b>http://127.0.0.1</b> instead.</p> <ul style="list-style-type: none"> <li>▪ <b>All IPs available on this computer:</b> Use all IP addresses available on this computer and enable access to the web server for all of these addresses. <b>Note:</b> The TCP port selected below must be free on every available IP address.</li> <li>▪ <b>Specify IPs:</b> Select specific IP addresses on which the PRTG Web server will run on. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header. <b>Note:</b> Either the selected port or at least one port in the range from <b>8080</b> to <b>8089</b> has to be available on the specified IP address.</li> </ul> <p><b>Note:</b> Regardless of the selected setting above, one port in the range from <b>8080</b> to <b>8180</b> has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports.</p> <p><b>Note:</b> If PRTG does not find a network card on startup it will switch the IP setting to <b>Localhost</b>. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.</p>

Web Server	
	<p><b>Note:</b> If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a><sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a><sup>[1950]</sup> will be disconnected. After clicking on the <b>Save</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p>
TCP Port for Web Server	<p>PRTG is running a web server in order to provide the web and Windows interface. Please specify on which port this web server will run. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Secure HTTPS server (recommended, mandatory for internet access):</b> This is the recommended setting and needed to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443.  <b>Note:</b> Although the connection is secure, you will see an <a href="#">SSL Certificate Warning</a><sup>[105]</sup> in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see <a href="#">Using Your Own SSL Certificate</a><sup>[2076]</sup>.  <b>Note:</b> If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior using a registry setting.</li> <li>▪ <b>Insecure HTTP server (standard port 80, not recommended):</b> Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections.  <b>Note:</b> If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.</li> <li>▪ <b>Expert configuration:</b> This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below.</li> </ul> <p><b>Note:</b> If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a><sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a><sup>[1950]</sup> will be disconnected. After clicking on the <b>Save</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p>
Web Server Port	<p>This setting is only visible if the expert configuration is selected above. Enter the desired TCP port number you want the PRTG web server to run on. Please enter an integer value.</p>

Web Server	
	<p><b>Note:</b> If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to the custom port via HTTPS. You can change this behavior using a registry setting.</p> <p><b>Note:</b> If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a><sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a><sup>[1950]</sup> will be disconnected. After clicking on the <b>Save</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p>
Web Server Security	<p>This setting is only visible if the expert configuration is selected above. Specify if you want to use an SSL encryption. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use SSL encryption (HTTPS):</b> Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above.  <b>Note:</b> Although the connection is secure, you will see an <a href="#">SSL Certificate Warning</a><sup>[105]</sup> in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see <a href="#">Using Your Own SSL Certificate</a><sup>[2076]</sup>.</li> <li>▪ <b>Don't use encryption (not recommended):</b> This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above.  <b>Note:</b> If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.</li> </ul> <p><b>Note:</b> If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a><sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a><sup>[1950]</sup> will be disconnected. After clicking on the <b>Save</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p>
Currently Active IP Address/Port Combination(s)	<p>Shows all currently active combinations of IP addresses and ports on which the PRTG server listens for web requests. This setting is shown for your information only and cannot be changed here.</p> <p><b>Note:</b> PRTG internally uses port 8085 for report generation.</p>

**Graph Settings: Select for how many days historic data remains accessible**

PRTG shows several graphs in the [objects' detail pages](#)<sup>[124]</sup> in the web interface. These are kept in RAM memory for fast display without causing extra CPU load or disk usage. The longer the time frames and the shorter the intervals are, the more memory will be used for this. You can adapt the details for all four graphs. This setting will also change the caption of the objects' tabs in the [web interface](#)<sup>[100]</sup> and [Enterprise Console](#)<sup>[1894]</sup>.

**Note:** If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the [Enterprise Console](#)<sup>[1894]</sup>, or of [Smart phone Apps](#)<sup>[1950]</sup> will be disconnected. After clicking on the **Save** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen.

**Live Graph**

The live graph is available for sensors only. For the live graph, no fixed time span is given, but you can define how many values will be displayed. The actual time span covered by the live graph depends on the scanning interval set for the sensor you're viewing and is calculated automatically. By default, **120 Values** is set, which results in a graph covering a time span of two hours, if a scanning interval of 60 seconds is set for the sensor. Other scanning intervals will result in graphs covering different time spans. Choose between:

- **60 Values:** This corresponds to a live graph covering a time span of one hour if a 1 minute scanning interval is set. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.
- **120 Values:** This corresponds to a live graph covering a time span of two hours if a 1 minute scanning interval is set.
- **240 Values:** This corresponds to a live graph covering a time span of four hours if a 1 minute scanning interval is set.
- **480 Values:** This corresponds to a live graph covering a time span of eight hours if a 1 minute scanning interval is set.
- **960 Values:** This corresponds to a live graph covering a time span of 16 hours if a 1 minute scanning interval is set. Uses most RAM memory.

**Graph 1**

By default, this is the **2 days** graph in the web interface. You can change it to more or less detail by choosing a time span and a monitoring interval average associated with it. Monitoring results will be averaged regardless of the actual scanning interval set for the sensors. Choose between:

- **1 day with 1 minute averages:** Results in 1440 values.
- **1 day with 5 minutes averages:** Results in 288 values.
- **1 day with 15 minutes averages:** Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.

**Graph Settings: Select for how many days historic data remains accessible**

	<ul style="list-style-type: none"> <li>▪ <b>2 days with 1 minute averages:</b> Results in 2880 values. Uses most RAM memory.</li> <li>▪ <b>2 days with 5 minutes averages:</b> Results in 576 values.</li> <li>▪ <b>2 days with 15 minutes averages:</b> Results in 192 values.</li> <li>▪ <b>4 days with 1 hour averages:</b> Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.</li> </ul>
Graph 2	<p>By default, this is the <b>30 days</b> graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>10 days with 1 hour averages:</b> Results in 240 values.</li> <li>▪ <b>20 days with 1 hour averages:</b> Results in 480 values.</li> <li>▪ <b>30 days with 1 hour averages:</b> Results in 720 values.</li> <li>▪ <b>30 days with 6 hour averages:</b> Results in 120 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.</li> <li>▪ <b>40 days with 1 hour averages:</b> Results in 960 values.</li> <li>▪ <b>40 days with 6 hour averages:</b> Results in 160 values.</li> <li>▪ <b>60 days with 1 hour averages:</b> Results in 1440 values. Uses most RAM memory.</li> <li>▪ <b>60 days with 6 hour averages:</b> Results in 240 values.</li> </ul>
Graph 3	<p>By default, this is the <b>365 days</b> graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>100 days with 1 day averages:</b> Results in 100 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.</li> <li>▪ <b>200 days with 1 day averages:</b> Results in 200 values.</li> <li>▪ <b>365 days with 1 day averages:</b> Results in 365 values.</li> <li>▪ <b>400 days with 1 day averages:</b> Results in 400 values.</li> <li>▪ <b>750 days with 1 day averages:</b> Results in 750 values. Uses most RAM memory.</li> </ul>

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

### 7.11.5 System Administration—Monitoring

In the monitoring settings you can define global values regarding scanning intervals, unusual and similar sensors detection, auto-discovery, and uptime threshold.

#### Monitoring Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

#### Scanning Intervals

##### Available Intervals

Define the intervals available in the drop down list of [every object's settings](#)<sup>[142]</sup>. In the text field, enter one value in each line. Use **s**, **m**, **h**, and **d** for defining seconds, minutes, hours, and days. By default, there are following scanning intervals defined:

**30s:** 30 seconds

**1m:** 1 minute

**5m:** 5 minutes

**10m:** 10 minutes

**15m:** 15 minutes

**30m:** 30 minutes

**1h:** 1 hour

**4h:** 4 hours

**6h:** 6 hours

**12h:** 12 hours

**1d:** 1 day

**Note:** We recommend not to use intervals shorter than 10 seconds to prevent system overload. Intervals below 10 seconds are not officially supported!

## Unusual Detection

The unusual detection can set sensors to an **Unusual status**<sup>[121]</sup> when there are values that are untypical for the time span they're measured in, compared to historic monitoring results. When disabled (both settings to **Never**), sensors will never be shown as unusual. **Note:** You can enable and disable unusual detection for any object (e.g. for a device, or an entire group) in the **Object Settings**<sup>[142]</sup>.

Show Unusual When	<p>Define when a sensor will be shown as unusual, comparing the weekday. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Never:</b> Disable unusual detection for weekday average.</li> <li>▪ <b>24h average is &lt;80% or &gt;120% of weekday average</b></li> <li>▪ <b>24h average is &lt;50% or &gt;200% of weekday average</b></li> <li>▪ <b>24h average is &lt;20% or &gt;500% of weekday average (recommended)</b></li> <li>▪ <b>24h average is &lt;10% or &gt;1,000% of weekday average</b></li> <li>▪ <b>24h average is &lt;1% or &gt;10,000% of weekday average</b></li> </ul>
Show Unusual When	<p>Define when a sensor will be shown as unusual, comparing the hour-of-day. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Never:</b> Disable unusual detection for hour-of-day average.</li> <li>▪ <b>24h average is &lt;80% or &gt;120% of hour-of-day average</b></li> <li>▪ <b>24h average is &lt;50% or &gt;200% of hour-of-day average</b></li> <li>▪ <b>24h average is &lt;20% or &gt;500% of hour-of-day average (recommended)</b></li> <li>▪ <b>24h average is &lt;10% or &gt;1,000% of hour-of-day average</b></li> <li>▪ <b>24h average is &lt;1% or &gt;10,000% of hour-of-day average</b></li> </ul>
Logging	<p>Define if unusual events will be written to the log file. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Do not log unusual events</b></li> <li>▪ <b>Write unusual events into the log</b></li> </ul>

### Similar Sensors Detection

Similar sensors detection enables PRTG to analyze sensor data for similarities. The detection will run in the background with low priority. The recommended setting for similar sensors detection is to let PRTG automatically decide how many channels will be analyzed. However, you can also override this setting. **Note:** When similar sensors analysis is turned off or you have exceeded 1,000 sensors and have chosen the automatic analysis depth option, the similar sensors entry will not be shown in the main menu bar.

Analysis Depth	<p>Define the number of channels PRTG will analyze to detect similarities between sensors or turn the analysis off. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Manage automatically based on sensor count (recommended):</b> The analysis depth depends on the total number of sensors you have configured. PRTG will analyze all channels for up to 500 sensors, and only the primary sensor channels for up to 1,000 sensors. If exceeding 1,000 sensors, the analysis will be turned off.</li> <li>▪ <b>Analyze primary channels only:</b> Only the primary channels of sensors are analyzed. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 1,000 sensors.</li> <li>▪ <b>Analyze all channels (higher CPU load):</b> Similarity detection is applied to all channels. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 500 sensors.</li> <li>▪ <b>Turn analysis off:</b> No similarity detection will take place. Choose this option if you are not interested in the analysis results or you want to keep PRTG's CPU load at a minimum.</li> </ul>
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Auto-Discovery Settings

Specific Hour	Auto-discoveries can produce a certain load, so you can define at which hour of the day <a href="#">auto-discoveries</a> <sup>[190]</sup> should be run when configured on a daily or weekly <b>Discovery Schedule</b> . Choose a full hour between <b>0:00</b> and <b>23:00</b> .
---------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Uptime Threshold

Minimum Allowed Uptime Threshold	Define which uptime in percent will be regarded as 100 percent. This setting affects the colors shown next to the sensor icons in reports. Select one of the predefined values between <b>90 %</b> and <b>99.999 %</b> .
----------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

### 7.11.6 System Administration—Notification Delivery

In the notification delivery settings you can define global settings for notification delivery. If you do not want to use a specific notification method, just leave the respective fields empty.

#### Note

This section describes one of three steps to set up the notification system in PRTG. A complete notification setup involves:

1. Check and set up the **Notification Delivery** settings. This will tell PRTG how to send messages.  
For detailed information, see [System Administration—Notification Delivery](#) <sup>1843</sup>.
2. Check and set up several **Notifications**. This will define the kind of message and its content.  
For detailed information, see [Account Settings—Notifications](#) <sup>1817</sup>.
3. Check and set up **Notification Triggers** for objects. These will provoke the defined notifications.  
For detailed information, see [Sensor Notifications Settings](#) <sup>1716</sup>.

For background information, please see [Notifications](#) <sup>1749</sup> section.

#### Notification Delivery Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Email Options	
Email Templates	<p>Choose which templates will be used for all emails sent.</p> <ul style="list-style-type: none"> <li>▪ <b>Use standard email templates (Recommended):</b> Use this option if you are not sure what to use. These templates offer the best compatibility with all email clients.</li> <li>▪ <b>Use templates from previous version (for upgrade installations from V7 only):</b> This option is provided for update installations from V7 only. Use it if you have updated from PRTG version 7 and really want to continue using the old email templates. This can be useful when using custom HTML templates in PRTG 7 format.</li> </ul> <p>Depending on the option selected, the content of the other fields in this section changes.</p>

Email Options	
Email Header (HTML)	Define the HTML text that will be used as the header for each HTML mail. To reset this field to its default value, click on the <b>trash can</b> icon left to the field or enter a single star symbol * (and nothing else).
Email Footer (HTML)	Define the HTML text that will be used as a suffix to every HTML mail. To reset this field to its default value, click on the <b>trash can</b> icon left to the field or enter a single star symbol * (and nothing else).
For Text Mails	<p>Select if a footer will be added to plain text mails. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Append text footer (default):</b> Add a text footer to all text mails. Define the text below.</li> <li>▪ <b>Do not append the footer</b> <b>Append text footer:</b> Do not add a footer to text mails.</li> </ul>
Email Footer (Text)	Define a text that will be used as a suffix to every plain text mail (if enabled above). You can use several placeholders in email templates. See the <a href="#">More</a> <sup>1838</sup> section below for more information. To reset this field to its default value, click on the <b>trash can</b> icon left to the field or enter a single star symbol * (and nothing else).

SMTP Delivery	
SMTP Delivery Mechanism	<p>Define how mails are sent using Simple Mail Transfer Protocol (SMTP). Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Direct delivery using built-in mail relay server (default):</b> Use the SMTP relay server built into PRTG. This server manages its own email queue. For each email, it will look up the target SMTP server via the MX record of the target domain, and send the email.</li> <li>▪ <b>Use SMTP relay server (recommended inside LANs/NATs):</b> Set up your own SMTP relay server to send emails. Enter data below.</li> <li>▪ <b>Use two SMTP relay servers (primary and fallback server):</b> Set up two own SMTP relay servers—one primary and one as fallback server. Enter data below.</li> </ul> <p><b>Note:</b> When monitoring inside your NAT or LAN it is often a good idea to use your own LAN-based relay server to deliver notification emails quicker.</p>

SMTP Delivery	
Sender Email	Enter an email address that will be used as sender of all emails. This setting is global and can only be changed centrally here.
Sender Name	Enter a name that will be used as sender of all emails. This setting is global and can only be changed centrally here.
HELO Ident	Enter the HELO Ident for SMTP. This must be a unique name, preferably the DNS name of the machine running PRTG. See SMTP RFC 2821: <b>The sender-SMTP must ensure that the domain parameter in a HELO command is a valid principal host domain name for the client host.</b>
SMTP Relay Server	This field is only visible if SMTP relay server is enabled above. Enter the IP address or DNS name of the SMTP relay server.
SMTP Relay SMTP Port	This field is only visible if SMTP relay server is enabled above. Enter the port number the SMTP relay server is running on. Standard value is 25.
SMTP Relay Authentication	<p>This field is only visible if SMTP relay server is enabled above. Select the kind of authentication required for the SMTP server. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No authentication is required:</b> Use SMTP without authentication.</li> <li>▪ <b>Use standard SMTP authentication:</b> Use standard authentication.</li> <li>▪ <b>SASL authentication is required:</b> Use secure authentication via Simple Authentication and Security Layer (SASL).</li> </ul>
SMTP Relay Username	This field is only visible if SMTP authentication is enabled above. Enter a valid user name.
SMTP Relay Password	This field is only visible if SMTP authentication is enabled above. Enter a valid password.
Use Encrypted Connection	<p>This field is only visible if SMTP relay server are enabled above. Enter the security level for SMTP connections. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Never:</b> Use insecure connection with plain text transfer.</li> <li>▪ <b>If supported by server:</b> Use a secure connection (default).</li> </ul>

SMTP Delivery	
SSL Method	This setting is only visible if SMTP relay server and encryption are enabled above. It is only relevant for secure connections. Select the SSL or TLS version which is supported by your SMTP device. We recommend using the default value. If you do not get a connection, try with another setting.
SMTP Relay Server (Fallback)	These fields are only visible if the option for two SMTP relay servers is enabled above. Please see respective settings for primary SMTP relay server above.
SMTP Relay SMTP Port (Fallback)	
SMTP Relay Authentication (Fallback)	
Use Encrypted Connection (Fallback)	
SSL Method (Fallback)	
SMTP Relay Username (Fallback)	
SSL Method (Fallback)	
SMTP Relay Username (Fallback)	
SMTP Relay Password (Fallback)	
Security (Fallback)	

SMS Delivery
<p><b>Note:</b> Although PRTG has built-in support for the Application Programming Interface (API) of some SMS providers, we cannot officially provide support regarding these SMS service providers. If you have technical questions about SMS delivery beyond PRTG, please contact your SMS provider directly. <b>Note:</b> Instead of using a pre-configured provider you can always use a custom URL, enabling you to use extended parameters (this is also an alternative when using providers for which we offer pre-configured options).</p>

**SMS Delivery**

You need an internet connection to send text messages via the HTTP API. For information about sending SMS via separate hardware using third party software, please see the [More](#) <sup>1848</sup> section below.

Configuration Mode	<p>Define how you want to select an SMS provider. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Select a SMS provider from a list of providers:</b> Select a provider from a list below.</li> <li>▪ <b>Enter a custom URL for a provider not listed:</b> Use another provider and enter the service URL manually below.</li> </ul>
Service Provider	<p>This field is only visible if the provider list is enabled above. Choose a service provider from the list. PRTG offers a small incomplete list of providers. <b>Note:</b> Some providers might require a port configuration in your firewall. See <a href="#">More</a> <sup>1848</sup> section below for more information.</p>
Username	<p>This field is only visible if the provider list is enabled above. Enter a user name for the service provider account.</p>
Password	<p>This field is only visible if the provider list is enabled above. Enter a password for the service provider account.</p>
API ID / Account	<p>This field is only visible if the provider list is enabled above. Some providers need an additional API ID or account information. If provided, enter it here. Please enter a string or leave the field empty.</p>
Custom URL	<p>This field is only visible if the custom provider option is enabled above. From the documentation of your SMS provider, please enter the service URL that is used to send SMS messages. Use the following placeholders for the recipient phone number and the text message: %SMSNUMBER, %SMSTEXT.</p>
Maximum Length of Text	<p>Some SMS providers will not allow SMS messages exceeding a certain amount of characters. PRTG will restrict the number of characters according to the length specified in this field. A value of 0 means the SMS is sent at its full length.</p>

**Note:** The [notification](#) <sup>1817</sup> methods "Send SMS/Pager Message" and "Execute HTTP Action" will use the central proxy settings defined for your PRTG core server. For details, please see [System Administration—Core & Probes](#) <sup>1849</sup> (section **Proxy Configuration**).

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## 7.11.7 System Administration—Core & Probes

In the core and probe management settings you can define settings for the core server, as well as the settings for probe connections if you use remote and/or mini probes.

### Core and Probes Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

Proxy Configuration	
Use Proxy Server	<p>We recommend using PRTG with a direct internet connection. However, if you need to use a proxy, you can configure according settings here. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No, use direct connection to the Internet (default):</b> Do not use a proxy. Use this setting if there is a direct internet connection available to the server running the PRTG core server.</li> <li>▪ <b>Yes, in our network a proxy is mandatory:</b> Define proxy settings below.</li> </ul> <p><b>Note:</b> Proxy settings are valid for <a href="#">Auto-Update</a><sup>1678</sup>, <a href="#">Activate the Product</a><sup>160</sup>, obtaining <a href="#">Geo Maps</a><sup>1744</sup> tiles, and for sending out HTTP and SMS text message <a href="#">Notifications</a><sup>1820</sup>.</p>
Proxy Server	This setting is only visible if proxy usage is enabled above. Enter the address of the proxy server that will be used for outbound connections. Please enter a valid address.
Port	This setting is only visible if proxy usage is enabled above. Enter the port of the proxy server that will be used for outbound connections. Please enter an integer value.
Use Proxy Credentials	<p>This setting is only visible if proxy usage is enabled above. Determine whether the proxy server needs credentials. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Yes:</b> Define credentials below.</li> <li>▪ <b>No:</b> Do not use credentials for proxy connections.</li> </ul>
Username	This setting is only visible if proxy credentials are enabled above. Enter a username for proxy authentication. Please enter a string.

### Proxy Configuration

Password

This setting is only visible if proxy credentials are enabled above. Enter a password for proxy authentication. Please enter a string.

### Probe Connection Settings

Probe Connections IPs

Define how PRTG will handle incoming connections from probes. Choose between the following options:

- **Local Probe only, 127.0.0.1 (PRTG will not be accessible for Remote Probes):** This is the default setting. Only local probe connections will be accepted by the PRTG core server. You cannot use [remote probes](#) with this setting enabled.
- **All IPs available on this computer:** Use all IP addresses available on this computer and enable access to the core server for all of these addresses.
- **Specify IPs:** Incoming connections from [remote probes](#) will only be accepted on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front the IPs. You can also select and deselect all addresses by clicking on the check box in the table header.

**Note:** If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the [Enterprise Console](#), or of [Smart phone Apps](#) will be disconnected. After clicking on the **Save** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen.

Probe Connection Port

Define on which TCP port number PRTG listens to for incoming probe connections. Enter a port number. We recommend using the default value.

**Note:** If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the [Enterprise Console](#), or of [Smart phone Apps](#) will be disconnected. After clicking on the **Save** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen.

Probe Connection Settings	
Access Keys	Enter a list of access keys, one in each line. Every (remote) probe that wants to connect to this PRTG installation has to use one of these keys. For information how to set this key for a probe, please see <a href="#">PRTG Probe Administrator</a> <sup>(2016)</sup> (Probe Settings) section.
Allow IPs	<p>Enter a list of remote probe IPs that will be accepted when connecting to this PRTG installation; each IP address in one line. The local probe (127.0.0.1) is always allowed automatically. Allowed IPs are checked first (before denied IPs). You can use PRTG's syntax for IP address ranges here (for information about the syntax please see <a href="#">Define IP Ranges</a> <sup>(2036)</sup> section).</p> <ul style="list-style-type: none"> <li>▪ <b>[Empty]</b>: An empty field does not allow any remote probes (but only the local probe). Please enter IP addresses to allow remote probe connections.</li> <li>▪ <b>any</b>: Enter the word <b>any</b> to automatically allow all remote probe connections. <b>Note</b>: This is recommended for use in Intranets only!</li> </ul> <p><b>Note</b>: If the IP address of your remote probe changes regularly (e.g. due to an internet provider assigning IP addresses dynamically), please enter the potential IP range for this remote probe or use the <b>any</b> option.</p>
Deny IPs	Enter a list of remote probe IPs that will <b>not</b> be accepted when connecting to this PRTG installation; each IP address in one line. This is useful to explicitly deny connections from certain remote probes you do not want to include in your setup any more (e.g., for a certain time). Access to IP addresses allowed above will be denied if you enter them here. This is useful to allow access to an IP range in the field above, but deny access to a single IP address. You can use PRTG's syntax for IP address ranges here (see <a href="#">Define IP Ranges</a> <sup>(2036)</sup> section).
Deny GIDs	Enter a list of GIDs, each global ID (GID) in one line. The access to matching GIDs will be denied. If you remove a remote probe from the device tree or if you deny a remote probe after installation, its global ID (GID) will be automatically entered here. This specific remote probe will not be able to connect anymore. Denying GIDs is more precise than denying IPs, where other remote probes at the same location could be excluded too.
Mini Probes	<p>Define if Mini Probes will be able to connect to your PRTG server. If you want to use Mini Probes, you must allow them to connect. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>No Mini Probes</b></li> <li>▪ <b>Allow Mini Probes to connect</b></li> </ul>

### Probe Connection Settings

See the [PRTG API](#)<sup>[2031]</sup> for the Mini Probe documentation.

**Note:** If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the [Enterprise Console](#)<sup>[1894]</sup>, or of [Smart phone Apps](#)<sup>[1950]</sup> will be disconnected. After clicking on the **Save** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen.

### Active Directory Integration

Domain Name	In order to use <a href="#">Active Directory Integration</a> <sup>[2029]</sup> please enter the name of your local domain. Please enter a string or leave the field empty.
Access Type	<p>Define which user account will be used to configure Active Directory access. This account will be used to query the AD for existing groups. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Use the PRTG core service account (usually LOCAL SYSTEM):</b> Use the same Windows user account configured for the "PRTG Core Server Service". In a default installation, this is the "local system" Windows user account. If this account does not have the right to query all groups of your Active Directory you should not use this option.</li> <li>▪ <b>Use explicit credentials:</b> Define a user account that will be used by PRTG to authenticate against the Active Directory. This should be a user account with full access to all of your Active Directory groups.</li> </ul>
Access User	This field is only visible if the use of explicit credentials is chosen above. Enter the Windows user account name which will be used to authenticate for Active Directory configuration.
Access Password	This field is only visible if the use of explicit credentials is chosen above. Enter the password for the Windows user account which will be used to authenticate for Active Directory configuration.

**Historic Data Purging Limits: Select for how many days historic data remains accessible**

Data purging enables you to automatically delete unnecessary data to free up disk space and improve system performance. You can define different time spans for several kinds of data. Select here for how many days historic data remains accessible. For further information on storage locations, please see [Data Storage](#)<sup>[2074]</sup> section.

Logfile Records	Define how long records in the system logfile <b>Log Database.db</b> will be kept. Enter a value in days. All entries older than this value will be deleted from the log file automatically. Keep this value as low as possible to enhance system performance.
Web Server Log Records	PRTG creates one web server log file every day. Define how many web server log files will be kept. Enter a value in days. All web server log files older than this value will be deleted automatically.
Historic Sensor Data	Define for how many days historic sensor data will be kept for all sensors. It is used to create <a href="#">reports</a> <sup>[1775]</sup> of monitoring data. Enter a value in days. Depending on the used intervals and the number of sensors in your setup, the file containing this data can become large. For smaller installations (500 sensors or less) a value of 365 should be fine. Historic sensor data is the basis for reports on monitoring data. If you decrease this value, there will be less historic monitoring data available!
Toplist Records	Define how long toplist records for <a href="#">Flow</a> <sup>[1966]</sup> and <a href="#">Packet Sniffer</a> <sup>[1964]</sup> sensors will be kept. Enter a value in days. We recommend using 30 days here.
Closed Tickets	Define how long tickets which are in status <b>closed</b> will be kept. Enter a value in days.
Reports	Reports generated in PDF format are stored on disk for later reference. Define the maximum age for these reports. Enter a value in days. All reports older than this value will be deleted automatically.
Configuration Auto-Backups	PRTG creates one backup of your configuration every day. Define the maximum age for these backups. Enter a value in days. All configuration backup files older than this value will be deleted automatically.
Full HTTP Sensor Screenshots	Define how long the screenshots of the <a href="#">HTTP Full Web Page Sensor</a> <sup>[528]</sup> (PhantomJS browser engine) will be kept. Enter a value in days. PRTG will delete older screenshots with every sensor scan.

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## Remote Probe Setup

Find more information about setting up remote probes in the [Multiple Probes and Remote Probes](#)  section.

### More

- [Define IP Ranges](#) 

### 7.11.8 System Administration—Cluster

In the cluster settings you can define the cluster settings. During [Failover Cluster Configuration](#)<sup>2004</sup>, the cluster settings were already pre-defined. See the [cluster status](#)<sup>1883</sup> to see if all nodes in your cluster are properly connected.

#### Cluster Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

You can set up two, three, four, or five nodes in one cluster. In the table of the cluster settings, the information of each node is written in one line.

Cluster Node Set up	
Node Name	Enter the name of the node (for display purposes).
Node ID	The ID is unique for every node. We recommend using the default value.
Node State	<p>You can set the state for every failover node. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Active:</b> Set the node to be active.</li> <li>▪ <b>Inactive:</b> Set the node to be not active. It will be disabled in the cluster configuration. It will then be not an active part of the cluster and will not appear in the <a href="#">cluster status</a><sup>1883</sup> any more.</li> </ul> <p>This setting is not available for the master node of a cluster. The master is always set to <b>Active</b>.</p>
IPs/DNS Names used for Connections Between Nodes	Define the IP addresses or DNS names that will be used for the connections between the nodes. You can enter different values for every node-node connection. For example, in the field #2 => #1, enter the IP address that the second cluster member (this is a failover node) will use to connect to the master node server.

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

In order to put a cluster node to **Maintenance Mode**, please see [PRTG Status—Cluster Status](#)<sup>1883</sup>.

The entire setup process for a cluster requires several different steps. For more information and step-by-step guidance, please see [Failover Cluster Configuration](#)<sup>2004</sup> section.

## 7.11.9 System Administration—User Accounts

PRTG administrator users can change all users' account settings and add new users.

### User Accounts Overview

- To change a user's settings, select it from the list by clicking on the user name. The available setting options are the same as shown in the [My Account](#) settings of the currently logged in user (plus some account control options).
- To add a new user, click on the **New User** button. The options are the same as for existing users (with slight differences).
- To batch-add several users at once in a simple way, please click the **Multiple New Users** button. In the dialog box appearing, select an existing [user group](#) from the drop down menu and enter or paste a list of email addresses. They can be separated by space, comma, semicolon, or a new line. Click the **Add** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group, click on the **New User Group** button. The options are the same as for existing groups (with slight differences).
- Access rights in PRTG are given via user groups. Please make sure a user account is member of the correct [user group](#) and give access to this group in your device tree [object's settings](#).

**Note:** Predefined objects cannot be deleted!

### User Accounts Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

User Account	
Login Name	Enter the login name for the user.
Display Name	Enter a name for the user for display purposes. This will not be used for login.
Email Address	Enter the user's email address.
Timezone	Enter the time zone for the current user.
Date Format	Enter in what format dates will be displayed for the current user. <b>Note:</b> This setting will take effect after the next login.

User Account	
Password	<p>Define the user's password. For security reasons, the account settings page does not contain the password. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Don't change</b></li> <li>▪ <b>Specify new password</b></li> </ul> <p>If you choose to specify a new password, enter the old password, and the new password twice.</p> <p><b>Note:</b> The new password must be at least 8 characters long; no character may occur more than 3 times. It must contain a number and a capital letter.</p>
Hash	<p>The hash (passhash) value can be used as password substitute when calling functions from PRTG's Application Programming Interface (API) that require an authentication. For more information please see <a href="#">Using the PRTG API (Application Programming Interface)</a> <sup>2031</sup> section.</p>

Auto Refresh and Alerting	
Auto Refresh Type	<p>Specify how PRTG's web pages will be refreshed for the current user. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Refresh page elements using AJAX (recommended):</b> Automatically refresh the single page elements on the web pages.</li> <li>▪ <b>Refresh whole page:</b> Automatically reload the whole page with every refresh interval.</li> <li>▪ <b>No auto refresh:</b> Do not automatically refresh web pages.</li> </ul>
Auto Refresh Interval (Sec.)	<p>This setting is only relevant when auto refresh is enabled above. Enter the number of seconds that will be waited between two refreshes. We recommend using 30 seconds or more. Minimum value is 20 seconds. <b>Note:</b> Shorter intervals create more CPU load on the server running the PRTG core server. If you experience load problems while using the web interface (or PRTG <a href="#">maps</a> <sup>1794</sup>), please set a higher interval.</p>
Play Audible Alarms	<p>Define when an audible alarm will be played for the current user on web pages whenever there are <a href="#">alarms</a> <sup>144</sup> in PRTG. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Never:</b> Do not play sound files on any web pages.</li> </ul>

### Auto Refresh and Alerting

- **On dashboard pages only:** When there are alarms, play a predefined sound on [dashboard](#)<sup>175</sup> pages only. The sound will be replayed with every refresh of a dashboard page.
- **On all pages:** When there are alarms, play a predefined sound on all web pages. The sound will be replayed with every page refresh.

For more information about audible notifications and supported browsers, please see [More](#)<sup>1816</sup> section below.

### Ticket System

#### Email Notifications

Define if you want to get emails from the ticket system. Choose between:

- **I want to receive an email whenever a ticket changes:** You will receive an email each time a ticket is assigned to you or your user group, or if a ticket which is assigned to you or your user group is changed. **Note:** If you edit tickets which are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email.
- **I do not want to receive any emails from the ticket system:** You will not get any emails about tickets.

### Web Interface

#### Homepage URL

Define the user's default page loaded after login and when clicking on the [Home](#)<sup>175</sup> button in main menu.

#### Max. Groups/Devices per Group

In order to provide you with a speedy user experience PRTG tries to keep the page size for the page showing the device tree small by automatically folding groups and devices with many items. Define how many groups and devices are shown at maximum before the automatic reduction is performed. We recommend using a value between **10** and **30**.

#### Max. Sensors per Device

In order to provide you with a speedy user experience PRTG tries to keep the page size for the page showing the device tree small by automatically folding groups and devices with many items. Define how many sensors are shown at maximum before the automatic reduction is performed. We recommend using a value between **10** and **30**.

Account Control	
Account Type	<p>This setting is only shown for administrator users. However, it is not shown if the user you modify the account settings for is a member of a group with administrative rights.</p> <p>Define the account type for the current user. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Read/Write User:</b> The user may change settings.</li> <li>▪ <b>Read Only User:</b> The user may not edit any settings. This is a good choice for public or semi-public logins.</li> </ul> <p><b>Note:</b> This setting cannot be changed for the default administrator user.</p>
Allow Acknowledge Alarms	<p>This setting is only visible if read only user is enabled above. Acknowledging an alarm is an action which requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may <a href="#">acknowledge alarms</a><sup>[145]</sup>. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Allow:</b> Allow acknowledging alarms for this user.</li> <li>▪ <b>Deny:</b> The user will not be able to acknowledge alarms.</li> </ul>
Primary Group	<p>This setting is only shown for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience, there is no difference between the primary and other user groups.</p>
Status	<p>This setting is only shown for administrator users. Define the status of the current user. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Active:</b> The current user can login to the account.</li> <li>▪ <b>Inactive:</b> The current user's login is disabled. Use this option to temporarily deny access for this user.</li> </ul> <p><b>Note:</b> This setting cannot be changed for the default administrator user.</p>
Last Login	<p>Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.</p>
User Groups	
Member of	<p>Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.</p>

## Comments

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

## History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the PRTG user which conducted the change, and a message. The history log keeps the last 100 entries.

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

## More

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- <http://kb.paessler.com/en/topic/26303>

### 7.11.10 System Administration—User Groups

PRTG administrator users can change existing user groups or add new ones, and define the users that are member of a certain group.

All the security settings as well as further rights management are conducted via the user groups. This means that group membership controls what a user may do and which objects the user will see when logged in. The actual rights for each object can be defined in an object's settings. There, you can define different rights for each user group.

- To change a user group's settings, select it from the list by clicking on the group name.
- To add a new user, click on the **New User** button. The options are the same as for existing users (with slight differences).
- To batch-add several users at once in a simple way, please click the **Multiple New Users** button. In the dialog box appearing, select an existing [user group](#)<sup>[186]</sup> from the drop down menu and enter or paste a list of email addresses. They can be separated by space, comma, semicolon, or a new line. Click the **Add** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group, click on the **New User Group** button. The options are the same as for existing groups (with slight differences).
- By default, there aren't any rights set for a newly created PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree. Please edit your device tree [object's settings](#)<sup>[142]</sup> and set access rights for your newly created user group in the **Inherit Access Rights** section. **Note:** The easiest way is to set these rights in the [Root Group Settings](#)<sup>[224]</sup>.

**Note:** The multi-edit option is not available for the standard user groups PRTG Administrators and PRTG Users Group.

**Note:** Predefined objects cannot be deleted!

#### User Groups Settings

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

##### User Group Settings

User Group Name	Enter a name for the user group.
-----------------	----------------------------------

User Group Settings	
Administrative Rights	<p>Define if the members of this group will be PRTG administrators. If you enable this option, all members of this group will have full access to all monitoring objects, maps, reports, user accounts and user groups, and they can change the PRTG monitoring configuration. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Yes:</b> Give full PRTG administrator rights to all members of this group.</li> <li>▪ <b>No:</b> Do not make members of this group administrators. Access to monitoring objects for users that are member of this group will be controlled by the <b>Access Rights</b> settings defined in the <a href="#">Object Settings</a><sup>[142]</sup> of Probes, Groups, Devices, or Sensors.</li> </ul> <p><b>Note:</b> This option is especially useful in combination with the Active Directory option below.</p>
Default Homepage	<p>Enter a PRTG internal web page. This will set the default homepage for all new users created with this group. A user will be redirected to this page after logging in. This concerns new users either added by an <b>Active Directory</b> login or by the <b>Add multiple users</b> feature.</p>
Use Active Directory	<p>Define if this PRTG user group will be connected to a group in your active directory. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Yes:</b> Connect this group to an AD group. Choose below. For detailed information, please see <a href="#">Active Directory Integration</a><sup>[2029]</sup>.</li> <li>▪ <b>No:</b> Do not use Active Directory integration for this group, but choose local user accounts instead.</li> </ul>
Active Directory Group	<p>If a valid Active Directory Domain is set in the <a href="#">System Administration—Core &amp; Probes</a><sup>[1862]</sup> settings and Active Directory integration is enabled above, a drop down menu will appear, showing the groups in your Active Directory. Choose the group whose members will be able to log in to PRTG using their Active Directory domain credentials. All of those AD users will be in the security context of the PRTG group you're about to create/edit. For detailed information, please see <a href="#">Active Directory Integration</a><sup>[2029]</sup>.</p> <p>If your Active Directory contains more than 1000 entries in total, PRTG will display an input field instead of a drop down menu. This is done due to performance reasons. In the input field, you can enter the group name only. PRTG will then add the prefix automatically.</p>

User Group Settings	
New User Type	<p>If Active Directory integration is enabled above, define the default rights for all new users in this user group. If a user logs in for the first time using Active Directory credentials, PRTG will automatically create a new local user account for this user, applying the user type defined here. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Read/Write User:</b> The user may change settings.</li> <li>▪ <b>Read Only User:</b> The user may not edit any settings. This is a good choice for public or semi-public logins.</li> </ul>
Allowed Sensors	<p>Define if members of this user group will be able to create all available sensor types or only specific ones. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Users may always create all sensor types:</b> No restrictions for group members are applied.</li> <li>▪ <b>Users may create certain sensor types only:</b> Choose the allowed sensor types below. This option is especially interesting for a Managed Service Provider (MSP).</li> </ul>
Users May Create These Sensor Types	<p>This field is only visible if you defined that the users in this group are only allowed to create certain sensor types. A list of all available types is shown with their name. Select the desired types by adding check marks in front of the respective lines. You can also select and deselect all items by using the check box in the table head.</p>
Ticket System Access	<p>Define if the members of this user group will be able to use PRTG's <a href="#">ticket system</a><sup>149</sup>. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Members can use the Ticket System:</b> No restrictions for group members are applied.</li> <li>▪ <b>Members can NOT use the Ticket System:</b> The <a href="#">Tickets</a><sup>183</sup> <a href="#">option in the main menu bar</a><sup>183</sup> will not be visible to users in this group.</li> </ul>
Members	
Members	<p>This setting is available only if Active Directory integration is disabled above. Define which local user accounts will be a member of this group. To add a user account from the list, add a check mark in front of the user name. The user accounts available depend on your setup.</p>

### Primary Users

#### User List

Shows a list of all user accounts with this group set as primary group. This is shown for information purposes only. You can change it in a [user account's settings](#).

### Comments

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

### History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the PRTG user which conducted the change, and a message. The history log keeps the last 100 entries.

Click on the **Continue** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

### 7.11.11 System Administration—Administrative Tools

With the administrative tools you can start system specific processes for debugging purposes. Use them if Paessler's technical support staff advises you to do so. You can start the respective processes by clicking on the **Go!** button on the right.

The screenshot shows the PRTG Network Monitor web interface. At the top, there's a navigation bar with links like Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this is a status bar showing 'New Alarms: 3', 'New Log Entries: 149', and various status icons. The main section is titled 'System Administration' and has a sub-tab 'Administrative Tools'. Under this, there are two categories: 'CORE ADMINISTRATIVE TOOLS' and 'PROBE ADMINISTRATIVE TOOLS'. Each category lists several tasks with a brief description and a 'Go!' button to execute the task.

Task	Description	Action
Create Database Snapshot	Saves current configuration as ZIP file in folder 'Configuration Auto-Backups'.	Go!
Write Core Status File	Creates a debug file on the core system.	Go!
Clear Caches	Clears the webserver's internal caches for geomaps and Active Directory authentication.	Go!
Load Lookups	(Re)load the lookup files from the 'lookups/custom' folder.	Go!
Recalculate PRTG Graph Data Cache	Note: due to the recalculation the PRTG Core Server Service will be restarted.	Go!
Restart Core Server	Restarts the PRTG Core Server Service.	Go!
Write Probe Status Files	Creates a set of debug files on all probe systems.	Go!
Restart All Probes	Restarts all probe services.	Go!
Probe #1 "Local probe"	connected from: 127.0.0.1:62323 Last Data: 20.12.2013 14:06:47 (0 sec ago) (Mitteleuropäische Zeit)	Restart Probe

At the bottom of the page, there's a footer with 'PAESSLER', 'PRTG Network Monitor 13.4.9.3736+ [Canary]', '© 2013 Paessler AG', 'PRTG System Administrator', 'Refresh in 547 sec', and '20.12.2013 14:06:13'.

System Administrative Tools

## Core Administrative Tools

### Core Administrative Tools

#### Create Database Snapshot

This will create a snap shot of your PRTG configuration. This action can take up to 100 seconds. Once finished, you will find a ZIP file containing a \*.dat file in the **Configuration Auto-Backups** sub folder of your [PRTG data directory](#)<sup>2074</sup>. If you're running a PRTG cluster, this action is executed on the cluster node you're currently logged in to. The ZIP file follows the name pattern **PRTG Configuration (Snapshot YYYY-MM-DD HH-MM-SS).zip**.

Core Administrative Tools	
Write Core Status File	This will create status files of your PRTG core server. You will find the two text files in the <b>Logs (System)</b> sub folder of your <a href="#">PRTG data directory</a> <sup>[2074]</sup> . If you're running a PRTG cluster, this action is executed on the cluster node you're currently logged in to. The files are named <b>Core Status.txt</b> and <b>Core Memory.txt</b> . They are overwritten each time you click this button.
Clear Caches	PRTG caches tiles for <a href="#">Geo Maps</a> <sup>[1744]</sup> and user data for <a href="#">Active Directory Integration</a> <sup>[2029]</sup> . Use this button to delete the cache if you encounter broken geo map tiles, or if you changed a user's password in the Active Directory.
Load Lookups	This will (re)load the <a href="#">lookup files</a> <sup>[2039]</sup> from the <b>\lookups\custom</b> folder. In this folder your customized lookup files are stored. If you have created a new lookup file or changed something in an existing lookup file, it might be necessary to load or to reload these files.
Recalculate PRTG Graph Data Cache	<p>PRTG writes monitoring data to the disk constantly and keeps the graphs for your graph tabs in memory. If PRTG is ended unexpectedly, the graph cache may get corrupted. In this case, graphs may be shown empty or show wrong data.</p> <p>If you experience graph display problems, a graph recalculation will fix the problem. Click on <b>Go!</b> so that PRTG will delete the data cache file and recalculate it automatically.</p> <p><b>Note:</b> If you apply recalculation, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a><sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a><sup>[1990]</sup> will be disconnected. After clicking on the <b>Go!</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p> <p><b>Note:</b> Directly after this action your graphs will be empty. They will be re-filled successively while recalculation in the background progresses. Until recalculation is finished, performance of the PRTG web interface may be affected due to high disk I/O activity.</p>
Restart Core Server	<p>You can restart the PRTG core server service manually. Click on the <b>Go!</b> button for this purpose.</p> <p><b>Note:</b> If you restart the core server, all users of PRTG's web interface, of the <a href="#">Enterprise Console</a><sup>[1894]</sup>, or of <a href="#">Smart phone Apps</a><sup>[1990]</sup> will be disconnected. After clicking on the <b>Go!</b> button, a popup will appear which asks you to confirm the required core server restart. Click on <b>OK</b> to trigger the restart and follow the instructions on the screen.</p>

## Core Administrative Tools

**Note:** If you want to schedule an automatic restart of Windows services for both core server and probe service, please do so using the **PRTG Probe Administrator**. For more details see [PRTG Probe Administrator](#) <sup>2019</sup> (Start/Stop) section.

## Probe Administrative Tools

### Probe Administrative Tools

Write Probe Status Files

This will create status files of your PRTG probes. Status files will be written for the local probe running on the PRTG core server (if you're running a PRTG cluster, on the cluster node you're currently logged in to) as well as for all remote probes configured (if any). On the respective systems, you will find four text files in the **Logs (System)** sub folder of the [PRTG data directories](#) <sup>2074</sup>. The files follow the name pattern **Probe Memory XX.txt**, **ProbeState XX.txt**, **ProbeState AXX.txt**, and **ProbeState BXX.txt**. They are overwritten each time you click this button.

Restart All Probes

This will restart all PRTG probes as well as the local probe Windows service. If there are any [remote probes](#) <sup>2049</sup> configured, the probe Windows services on the respective remote systems will be restarted as well. In order to start single probes only, please see below. **Note:** If you're running a PRTG cluster, this action is executed on the cluster node you're currently logged in to. In this case, remote probes are only restarted if you're logged in to the primary master node. The cluster probe Windows service of failover nodes is not restarted if this action is executed on the master node. If you want to restart the cluster probe Windows service of a failover node, please log in to this failover node's web interface and click on the same button there.

Probe [#Number]  
"[Name]"

Information about the connection status is shown. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the "Local probe", the IP will always be IP 127.0.0.1. You will also see information about the date when the last data packet was received from the probe. If you want to restart a single probe, please click on the **Restart Probe** button. **Note:** Entries for every single probe are following.

There are some settings that have to be made in the [System Administration Tools](#)  1998, available as native Windows applications. For more details, please see sections:

- [PRTG Server Administrator](#)  1999
- [PRTG Probe Administrator](#)  2016

## 7.11.12 PRTG Status—System Status

### System Status

Click on the **System Status** tab to view relevant system information you may need for debugging or when the support team asks you to provide system information in order to support you with PRTG.

Software Version and Server Information	
PRTG Version	Shows the exact version of the build your PRTG installation is currently running on.
Auto-Update Status	Shows the latest auto-update message available from <a href="#">Software Auto-Update</a> <sup>1878</sup> . For example, the message will indicate any PRTG updates ready to be installed.
Operating System	Shows the exact Windows version build and service packs, the number and kind of CPUs, and the computer name, of the system the PRTG core server is installed on. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. <b>Note:</b> When running PRTG on virtual systems, not all of the mentioned values may be available.
Server Time	Shows the date and time of the system the PRTG core server is installed on. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Server CPU Load	Shows the current CPU load of the system the PRTG core server is installed on. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Username	Shows the <a href="#">username</a> <sup>1812</sup> of the PRTG user you're currently logged in as.
Browser	Shows the name and user agent string of the browser you're currently viewing this page with.

Licensing	
Licensee	Shows the Name of the <a href="#">license</a> <sup>[57]</sup> you're using for this installation of PRTG. Licensee (name) and license key together build your license information.
Key	Shows the beginning and the end of the <a href="#">license</a> <sup>[57]</sup> key you're using for this installation of PRTG. Licensee (name) and license key together build your license information.
Edition	Shows the PRTG edition you're using for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).
Activation Status	Shows the activation status of this installation of PRTG. Usually, activation is done automatically on first start-up. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, please see <a href="#">Activate the Product</a> <sup>[60]</sup> .
Software Maintenance	Shows the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support, without additional costs.
Number of Sensors	Shows the number of sensors you can use in your monitoring, with your current edition of PRTG (see above). If you reach the limit, each new sensor that you create will be set to a <b>Pause</b> status automatically. In order to upgrade your license right now, click on the <b>Need more sensors? Click here to upgrade!</b> button to visit our web shop. Editions that allow an <b>unlimited</b> number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit is reached. This means you can use about 20,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals); for details, see system requirements linked in the <a href="#">More</a> <sup>[1877]</sup> section below.

### System Startup Log

Shows the log information created during the last startup of the PRTG core server. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

**Cluster Status**

This box is only visible if you're running a PRTG cluster. This section lists all cluster nodes configured in your monitoring.

Node <b>[Number]</b>	Shows the name of the cluster node as well as the node type (primary/secondary node) and status (current master/failover node). Additionally, all connections from this node to the other cluster nodes are shown, as illustrated on the <a href="#">PRTG Status—Cluster Status</a> <small>1883</small> page.
----------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Local Status**

This box is only visible if you're running a PRTG cluster. This section lists information about the cluster node you're currently logged in to.

Server State Cluster Messages	Shows internal summary information about the current node and the communication between the nodes. You might be asked about this by Paessler's technical support staff.
-------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Cluster Connections**

This box is only visible if you're running a PRTG cluster. This section lists information about the connections between the different cluster nodes.

State of Local Node	Shows Treeversion and size of the Server Volume, both internal system information.
State of Cluster Members	For each cluster node, the name and IP address is shown, as well as a state CRC code, the time stamp of the last "keep alive" signal sent, the current size of the buffer, and the remote IP.
Message State of Cluster Members	For each cluster node, the name, IP address, and unique identifier is shown, as well as the connection state, and statistic information about the cluster message system which is used for the communication between the different nodes.

**Auto-Discovery Tasks**

Currently Running	Shows the number of auto-discovery tasks that are currently running. A high number of auto-discovery tasks can negatively influence system performance.
-------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------

**Background Tasks**

Historic Data	Shows if PRTG is re-calculating the historic data cache in the background. If so, you will see the tasks to do until done. Usually, this calculation is done after every core server restart.
Toplist Buffer	When using <a href="#">xFlow</a> <sup>[1966]</sup> or <a href="#">Packet Sniffer</a> <sup>[1964]</sup> sensors, PRTG stores Toplist data. The data stream received is buffered and written to the data directory of the core system. Depending on the number and size of the data stream as well as the hard disk and system performance of the core system, the buffer size can rise. When reaching a buffer size of <b>500</b> , Toplist data is dropped which can lead to incorrect Toplist values for the sensors.
Toplist Upgrade	If you recently updated from an older PRTG version (7 or 8), Toplist data needs to run through a one-time conversion process. While conversion is running you may experience a considerably slow monitoring system. Usually, you will see <b>n/a</b> here.
Similar Sensors Analysis	Shows current status and the selected setting for the analysis depth of the <a href="#">Similar Sensors</a> <sup>[138]</sup> analysis.

**Database Objects**

Shows statistic information about your monitoring configuration. This information might be necessary when contacting Paessler's technical support staff.	
Probes	Shows the total number of <a href="#">probes</a> <sup>[238]</sup> configured.
Groups	Shows the total number of <a href="#">groups</a> <sup>[253]</sup> in your configuration.
Devices	Shows the total number of <a href="#">devices</a> <sup>[272]</sup> in your configuration.
Sensors	Shows the total number of <a href="#">sensors</a> <sup>[290]</sup> in your configuration.

Database Objects	
User Groups	Shows the total number of <a href="#">user groups</a> <sup>1861</sup> in your configuration.
Users	Shows the total number of <a href="#">users</a> <sup>1866</sup> configured.
Notifications	Shows the total number of <a href="#">notifications</a> <sup>1817</sup> configured.
Schedules	Shows the total number of <a href="#">schedules</a> <sup>1827</sup> configured.
Maps	Shows the total number of created <a href="#">maps</a> <sup>1794</sup> in your installation.
Libraries	Shows the total number of created <a href="#">libraries</a> <sup>1759</sup> in your installation.
Reports	Shows the total number of <a href="#">reports</a> <sup>1775</sup> in your installation.
Requests/Second	Shows a value calculated from the total number of sensors and the average scanning interval configured. This number indicates how many monitoring requests per second are sent from the probe(s) to the devices in your network. There are no general guidelines what is a "good" value here. This depends on the sensor types used as well as on your system's performance.
Sensors	Shows a list with numbers and types of sensors used in your configuration. <b>Note:</b> In the list, internal short names are used for sensor types instead of the official designations.

### Sensors by Performance Impact

Shows all sensor types used in your configuration ordered by performance impact (from very low to very high). If your PRTG system is very slow, you can see which sensors might cause this issue. Please consider the recommended number of sensors in the respective [manual sections](#) <sup>290</sup> for sensors with high and very high performance impact. **Note:** In the list, internal short names are used for sensor types instead of the official designations.

### Sensors by Interval

Shows all sensor types used in your configuration ordered by scanning interval. Please choose reasonable scanning intervals for sensors which can affect the system performance. See the respective [manual sections](#)<sup>[290]</sup> for sensors for more information. **Note:** In the list, internal short names are used for sensor types instead of the official designations.

### Probes

This section lists all probes configured in your monitoring. If there are no remote probes configured, only the "Local probe" appears in the list, which runs mandatorily on the PRTG core server. **Note:** If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. Remote probes (if any) will only be shown when you're logged in to the primary master node. When logged in to a failover node, the cluster probe running on this node will appear as "Local probe".

Probe [#Number]  
"[Name]"

Information about the connection status is shown. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the "Local probe", the IP will always be IP 127.0.0.1. You will also see information about the date when the last data packet was received from the probe. If you want to restart a single probe, please go to the [Administrative Tools Settings](#)<sup>[1865]</sup>.

### System Settings

Web Server URL	Shows the URL to access the <a href="#">PRTG web interface</a> <sup>[100]</sup> . If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server IPs	Shows all IP addresses the PRTG web server is running at. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Ports	Shows the port the PRTG web server is running at. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Port Usage	Shows the number of ports used by the PRTG web server.

System Settings	
Incoming Probe Connection Binding	Shows a combination of the two values below.
Incoming Probe Connection IPs	Shows a list of all IP addresses on which your current PRTG installation listens to incoming remote probe connections. This is the same information as shown in the <a href="#">System Administration—Core &amp; Probes</a> <sup>[1849]</sup> settings. <b>0.0.0.0</b> means that the core server listens on all local network adapter IPs.
Incoming Probe Connection Port	Shows the port number on which your current PRTG installation listens to incoming remote probe connections. This is the same information as shown in the <a href="#">System Administration—Core &amp; Probes</a> <sup>[1849]</sup> settings. Default port is <b>23560</b> .
Probe Allow IPs	Shows all source IP addresses that will be accepted by the core server for incoming remote probe connections. This is the same information as shown in the <a href="#">System Administration—Core &amp; Probes</a> <sup>[1849]</sup> settings and can be changed there. <b>any</b> means that all remote probe connections are accepted, regardless of the IP address of the remote probe system.
Probe Deny IPs	Shows all source IP addresses that will be denied by the core server for incoming remote probe connections. This is the same information as shown in the <a href="#">System Administration—Core &amp; Probes</a> <sup>[1849]</sup> settings and can be changed there. Denied IPs are superior to allowed IPs. If this field is empty, there are no denied IPs. <b>Note:</b> PRTG automatically adds the IP address of a remote probe system to this list when you delete a remote probe from your <a href="#">device tree</a> <sup>[83]</sup> .
DataPath	Shows the path where PRTG stores its configuration, monitoring database, etc. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. In order to change this setting, please open the <a href="#">PRTG Server Administrator</a> <sup>[1999]</sup> on the system of the PRTG core server (or of the respective cluster node, if applicable).

### Web Server Activity

Shows statistic information about the web server since last startup. All values are reset when the core server is restarted. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

Web Server Activity	
Time Since Startup	Shows the time that has passed since the PRTG web server was started.
Page Views	Shows the total number of page views on this core server.
Geo Maps	Shows the total number of geo maps shown on this core server.
HTTP Requests	Shows the total number of HTTP requests to this core server.
HTTP Requests > 500/1000/5000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 500, 1,000, or 5,000 milliseconds.
Slow Request Ratio	Shows a calculated number of the HTTP request values above. The lower this number, the faster is your installation's web interface.

Synchronization	
<p>The core server holds the configuration of the entire monitoring and deploys it to the probes. This section shows statistic information about the synchronization of the core server with the local probe and all connected remote probes (if any), since last startup of the core server. All values shown here are reset when the core server is restarted. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. <b>Note:</b> Only when logged in to the primary master node you will see synchronization data for remote probe connections.</p>	
Last Synchronization with a Probe	Shows the time stamp of the last probe synchronization, and if there is still something to do.
Probe/Core Message Count	Shows the total number of messages sent between core and probe(s), as well as a calculated message speed value.
Raw Buffer Count	Shows the number of raw buffers and a corresponding status indicator.
Sync Cycle Speed	Shows the time necessary for a full synchronization, as well as an evaluation comment of this time (usually, this will be "OK").
Configuration Requests Sent	Shows the total number of configuration requests and the requests that still have to be sent.
Configuration Requests Deleted	Internal debug information. Usually, this value will be <b>0</b> .

### Synchronization

Configuration  
Requests With  
Response

Internal debug information. Usually, this value will be 0.

### System Warnings

If there are any warnings they will be shown here. Usually "None" will be shown here.

### Core System Memory

Shows machine-oriented information regarding the memory usage of the core server system. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

### Thread Information

Shows machine-oriented information regarding the threads running on the core server system. If you're running a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

### More

Paessler Website: Detailed System Requirements for PRTG Network Monitor

- <http://www.paessler.com/prtg/detailed-requirements>

Knowledge Base: How can I speed up PRTG—especially for large installations?

- <http://kb.paessler.com/en/topic/2733>

### 7.11.13 PRTG Status—Auto-Update

Whenever a new version of the software is available from the Paessler website PRTG will download the setup file automatically if a direct internet connection is available. The administrator will then receive a [ToDo ticket](#)<sup>[150]</sup> with instructions to initiate the update installation.

For customers using a [Freeware or Trial Edition](#)<sup>[19]</sup>, automatic software updates are available at any time. Customers using a [Commercial Edition](#)<sup>[20]</sup> need to have an active maintenance contract so updates are available.

#### Status

**Note:** This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be available as described. When using a cluster installation, failover nodes are read-only by default.

To view the auto-update page of your PRTG installation, select **Setup | Software Auto-Update** from main menu. On the **Status** tab you can download and perform updates.

#### Using Auto-Update

If there is a new version available, you will see detailed information about the available version. Please read these notes carefully! A summary of current and past release notes is given underneath update section; for detailed release notes, click on the button **PRTG Release Notes and Version History** which will redirect you to the corresponding page on [paessler.com](http://paessler.com).

In order to install an available version, click the **Install Update [version number]** button. You will be asked to confirm installation and license—and that's it!

**PRTG Network Monitor Auto-Update**

Here you can automatically update your PRTG installation.

- If you are using the freeware or trial edition you can always update to the latest version for free.
- If you are using a commercial edition your license key must be covered by a valid maintenance contract in order to download updates.
- You can always prolong your maintenance at <http://shop.paessler.com>

You can deactivate automatic downloading in the Settings tab.

**UPDATE STATUS FOR PRTG NETWORK MONITOR**

Remaining Maintenance Days	4711 (Last Check: 26 h 59 m ago)
Latest Message from Auto-Update	[13.05.2014 14:41:59] Version 14.2.12.2052 has been downloaded and will be installed at: 7h 00m

Latest Downloaded Version	14.2.12.2052 <b>NEW!</b> <a href="#">Install Update 14.2.12.2052</a>

File: PRTG Network Monitor 14.2.12.2052 Setup Commercial (Canary).exe

**RELEASE NOTES FOR VERSION: 14.2.12.2052**

**What's New In 14.x.10**

- Maintenance release with many bugfixes and small improvements
- System settings in the WebGUI have been overhauled and rearranged

**What Was New In Previous Version 14.x.9**

- [Sensors] 4 new sensor types for monitoring HTTP push data and for monitoring SANs that support CLI over SSH
- [Sensors] Several improvements and fixes for existing sensor types
- [GUI] Several improvements for the web interface, including a better dialog for adding sensors, better filters, and a hidden feature that shows geo tracking information (provided by the Android probe) on a geo map
- [Changed] Several web server and IP settings of the PRTG web server can now be changed in the web interface (was in the PRTG Server Administrator tool before)
- Numerous other changes, improvements, and bugfixes to the API and all other parts of PRTG

**What Was New In Previous Version 13.x.8**

For detailed information please visit: [PRTG Release Notes and Version History](#)

PAESSLER PRTG Network Monitor 14.2.11.2036 [Canary] © 2014 Paessler AG PRTG System Administrator Refresh in 24 sec 13.05.2014 17:38:26

Automatic Software Update Page

## Manually Install an Interim Update

Not all available updates from Paessler will be pushed to all customers, but they are still available from the website. Sometimes Paessler support may ask you to update to the latest version.

In this case please click the **Check For Latest Update and Download** button. PRTG will then connect to the Paessler servers and download the setup file, regardless of the status of the update-check. Then **Install Update [version number]**. **Note:** In order to use this function, a direct internet connection is necessary on the computer running the PRTG core server.

## Select Other Release Channel

PRTG is available in three different release channels. For details about continuous rollout and release channels, please see the blog article in the [More](#) section below.

In order to change the release channel you receive updates from, please open the auto-update [Settings](#) tab by clicking on the **Select Other Release Channel** button and change the settings in the **Release Channel** section.

## Log

Click on the **Log** tab to show log information regarding the update status of PRTG, newest first. In the [table list](#)<sup>[156]</sup> appearing, you can filter the items by using the [respective options](#)<sup>[156]</sup>. For more information, please see [Logs](#)<sup>[147]</sup> section.

## Settings

Click on the **Settings** tab to configure the **Software Auto-Update**.

Software Auto-Update	
When a New Version is Available	<p>Define how PRTG will react to available software updates. Choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatically download and install the latest version:</b> Any new PRTG version will be downloaded and installed automatically as soon as your installation detects that there is a newer version available (a check is performed once per day). <b>Note:</b> Without prior notice, installation will restart the PRTG Windows services and may also include a server restart.</li> <li>▪ <b>Automatically download the latest version and alert the admin:</b> Any new PRTG version will be downloaded automatically as soon as your installation detects that there is a newer version available (a check is performed once per day). After successful download, PRTG will create a ToDo message for the administrator.</li> <li>▪ <b>Alert the admin only:</b> When PRTG detects that there is a newer version available, it will not download updates automatically, but create a ToDo message only. You can still download updates manually on the <a href="#">Auto Update</a><sup>[1879]</sup> page.</li> </ul>
Installation Time	If you have select the automatic installation option above, choose the desired time for updates from the drop-down menu.
Release Channel	<p>PRTG updates are delivered in different release channels. You can choose between maximum stability, or most early access to new features. Please choose between:</p> <ul style="list-style-type: none"> <li>▪ <b>Stable: Updated about once per month (most conservative option, recommended):</b> These are our best tested versions. Choose this channel for live environments you have to depend on!</li> </ul>

### Software Auto-Update

- **Preview: Updated about once per week:** Versions in this channel are already thoroughly tested in our labs, but may still contain limitations in certain monitoring configurations. Choose this channel if you are willing to take a little risk for the benefit of getting new features and bug fixes a little earlier.
- **Canary: Updated daily (testing only, should not be used on live systems):** Updated every night. Use with CAUTION! Software versions in this channel are not tested yet, might contain severe bugs, and are provided for testing purposes only. We strongly recommend to **not** use those versions in live environments you have to depend on!

For more information about the different release channels, please see the blog article linked in the [More](#) <sup>1836</sup> section below.

Click on the **Save** button to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

### Notes

There are a few things we ask you to consider regarding automatic software updates:

- In order for auto-update to work the machine running the PRTG core server needs direct internet access. If a proxy connection is needed, please configure it in the [System Administration—Core & Probes](#) <sup>1840</sup> settings. For details about the update servers, see [More](#) <sup>1802</sup> section below.
- During installation the core server may be restarted without notice.
- Existing remote probes will be updated automatically, causing short downtimes in monitoring of remote locations. In rare cases a manual update of remote probes is required after you update the core server. In these cases you will be notified in the device tree, and monitoring of remote locations will be interrupted until you perform the manual update on the system(s) running the remote probe(s).
- In a cluster installation the update needs to be installed on one node only. The new version will then be deployed to all other cluster nodes automatically (causing a short downtime for the monitoring on the cluster nodes, one after another).
- If you run several individual PRTG core servers that are not in a cluster, for example, in combination with the [Enterprise Console](#) <sup>1894</sup>, an update has to be initiated and confirmed for each single core server.
- You can disable automatic downloading in the [Auto-Update settings](#) <sup>1880</sup>. Updates will then only be downloaded on request, when you click on the **Check For Latest Update and Download** button.

## 7.11.14 PRTG Status—Cluster Status

### Cluster Status

Click on the **Cluster Status** tab to view all nodes connected to the cluster. This tab is only available if you're running PRTG in [cluster mode](#)<sup>1855</sup>. Following information is shown:

- Cluster Status with all connected nodes as table and graphic
- Cluster Log with all log entries concerning cluster connections

**PRTG Status**

System Status | **Cluster Status**

**CLUSTER STATUS**

Node 1: PRTG Network Monitor (10.0.10.34)  
Primary Node (Current Master) | Start Maintenance Mode

Connection To	IP	State
→ Node 10.0.10.35	10.0.10.35	Connected

Node 2: Node 10.0.10.35  
Secondary Node (Failover Node, Version: 28728) | Start Maintenance Mode

Connection To	IP	State
→ PRTG Network Monitor (10.0.10.34)	10.0.10.34	Connected

**CLUSTER LOG**

Items: 50 | Date Range: 2013-12-13 00:00 - 2013-12-21 00:00 | Select Range

Date Time	Parent	Type	Object	Status	Message	Cluster Node
20.12.2013 13:57:05	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:4741" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 13:41:58	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:2106" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 13:26:52	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:3424" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 13:11:46	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:4712" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 12:56:40	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:2071" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 12:41:33	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:3412" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 12:26:27	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:4745" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 12:11:21	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:2064" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 11:56:14	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:3408" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 11:41:08	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:4731" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 11:26:02	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:2098" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 11:10:55	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:3416" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)
20.12.2013 10:55:49	None	Probe	Cluster Probe	Cluster	Cluster: Access denied for node at "10.0.10.33:3416" (Incorrect cluster access key)	PRTG Network Monitor (10.0.10.34)

Example of a PRTG Cluster Status View

Click on the **Start Maintenance Mode** link to put a cluster node in maintenance mode. A node in this mode is still connected to the cluster, but its monitoring results are discarded until you click on the **Stop Maintenance Mode** link. You can use this functionality to explicitly exclude a node from monitoring if you know that the monitoring values will not be accurate, for example, because you're reconfiguring things, etc. During maintenance, a cluster node is displayed with a transparent color in the overview graphic.

For more information about cluster settings, please see [System Administration—Cluster](#)<sup>1856</sup> section.

## 7.11.15 PRTG Status—Activation Status

### Activation Status

Click on the **Activation Status** tab to view information about the activation status of your PRTG Network Monitor license. For more details about activation, please see [Activate the Product](#)<sup>[60]</sup> section.

License Activation Status	
Licensed Edition	Shows the edition of the license you are currently using for this installation of PRTG. This determines how many sensors you can use in your monitoring. If you are running a PRTG cluster, this will show information for the system of the cluster node you are currently logged in to.
Current activation status of your software license	Shows the activation status of your PRTG license. Usually, activation is done automatically on first start-up. The activation status is typically <b>Activation OK</b> . Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, please see <a href="#">Activate the Product</a> <sup>[60]</sup> .
Last message about activation	Shows the last message regarding the activation of your license.
Current activation stamp	Shows an internal activation stamp code.

### 7.11.16 Optional Downloads and Add-Ons

To see optional downloads, select **Setup | Downloads / Add-Ons** from the main menu. Click on the tabs to switch between different options.

There are the following downloads available:

- [Client App for Windows \(Enterprise Console\)](#) 
- [Client Apps for Mobile Devices](#) 
- [Remote Probe Installer](#) 
- [PRTG Add-Ons](#) 
- [PRTG Billing Tool](#) 
- [Chrome Desktop Notifications](#) 

#### Client App for Windows (Enterprise Console)

Download the Windows Graphical User Interface (GUI) "Enterprise Console" to the current system. Using it, you can access the PRTG interface with a native Windows application. The version of the Enterprise Console must match your version of PRTG. For more information, please see [Install the Enterprise Console](#)  section.

#### Client Apps for Mobile Devices

**PRTG for iOS** is a native iPhone application that enables you to use the PRTG web interface with the original iFeeling. You can download PRTG for iOS on iTunes for free. **PRTG for Android** gives you the possibility to monitor PRTG on the go with your Android device, available for free as well. There are also apps available for Windows Phone and BlackBerry. For more information, please see [More](#)  section below.

#### Remote Probe Installer

With remote probes you can extend your monitoring to distributed networks that are not directly reachable from your PRTG core installation. The version of the remote probe installer must match your version of PRTG. For more information, please see [Install a PRTG Remote Probe](#)  section.

#### PRTG Add-Ons

This will display a link to the PRTG add-ons page on Google Code. There you will find a collection of various add-ons for PRTG Network Monitor and their source code. For more information, please see [More](#)  section below.

## PRTG Billing Tool

This will display a link to information and download of the PRTG Billing Tool. The PRTG Billing Tool is an application that can read PRTG sensor data and generate bills in PDF format. We provide this tool as a basis to develop your own billing applications. For more information, please see [More](#)<sup>1886</sup> section below.

## Chrome Desktop Notifications

This tab is only visible if you're accessing the PRTG web interface with Google Chrome browser. For details, please see [Chrome Desktop Notifications](#)<sup>1887</sup> section.

## More

- <http://www.paessler.com/apps>

Project Hosting on Google Code: PRTG AddOns

- <http://code.google.com/p/prtg-addons/>

Paessler Website: Billing Tool for PRTG

- <http://www.paessler.com/tools/billingtool>

### 7.11.17 Chrome Desktop Notifications

While you are logged in to the PRTG web interface with your Chrome browser, PRTG can use it to show notifications on your desktop whenever there are new alarms in your monitoring.

Desktop notifications will be shown (by default, in the lower right corner of your desktop) whenever there are new alarms after a page refresh. The notification will display the number of new alarms and the current number of each sensor status. Click on **X** to close the notification.

Example of a Chrome Desktop Notification

In Chrome's default configuration, you have to initially allow those notifications for each installation/profile of Google Chrome. To do so, in the PRTG web interface, please click on [Set up](#)<sup>1810</sup>, then click on **Chrome Desktop Notifications**.

Chrome Desktop Notifications in Setup

### Chrome Desktop Notifications Settings

On the settings page, you see one of the following status messages.

#### Status: Click button below to enable Desktop Notifications

- Click on the **Enable Chrome Desktop Notifications** button to add your PRTG URL to Chrome's list of allowed sites for desktop notifications.
- On top of your Chrome browser window a message will appear, asking you to allow desktop notifications. Click on **Allow** to add the web interface's URL to the allowed sites.

Click on 'Allow' to enable Chrome Desktop Notifications

#### Status: Sorry, Desktop Notifications cannot be enabled

- Desktop Notifications are explicitly blocked for the PRTG web interface's URL in the Chrome options. Please see [Notifications Settings in Google Chrome](#)<sup>1887</sup> below.

### Desktop Notifications enabled

- Chrome Desktop Notifications are successfully activated. In order to disable them, please see [Notifications Settings in Google Chrome](#) below.

### Notifications Settings in Google Chrome

To disallow or re-allow your web interface's URL for desktop notifications, please edit your Chrome browser's options:

Choose **Options | Under the Hood**, in the **Privacy** section, click on the button **Content settings....** In the **Notifications** section, change settings corresponding to your needs. For example, click on **Manage exceptions...** and remove the URL of your PRTG web interface to disable the feature. Or remove a blocked URL to re-enable the feature again.

### 7.11.18 Support—Contact Support

To open the **Contact Paessler Support / Send Your Feedback to Paessler** window in PRTG, choose **Setup | Contact Support** from the main menu. You can open this form also via the footer **Contact Support** on any page in PRTG.

On the one hand, you can adapt this page as **feedback** form. Help improve PRTG by providing criticism, praise, bug reports, and feature requests. Any comments are welcome! Your feedback will be handled directly by the Paessler support team.

On the other hand, you can use this function in order to ask for support regarding technical issues. To make the support contact more comfortable, PRTG can automatically attach a screenshot in combination with a **Support Bundle** which contains several selected PRTG log and status files. This information will help the support team a lot in order to analyze any issues you may have encountered with PRTG. Please also consider the suggested links to articles regarding the scope of your issue.

Once you are finished, click on **Submit to Paessler Support** to send your request, or click on **Cancel** to return to the page from which you opened the contact form. You can be sure that you will receive an answer by our support team within one or two business days, no matter whether you provide feedback or you have a question.

**Note:** PRTG will try to send your feedback / support question to Paessler as an email using Simple Mail Transfer Protocol (SMTP). Please ensure that your PRTG installation is able to send emails to external destinations!

## Part 7: Ajax Web Interface—Advanced Procedures | 11 Setup 18 Support—Contact Support

### Contact Paessler Support / Send Your Feedback to Paessler

Help us to improve PRTG! We look forward to your criticism, praise, feature requests. Anything. Your feedback will be handled by the Paessler support team and you can expect an email reply within 1-2 business days. Please note: Your PRTG server will try to send this information to Paessler as an email using SMTP (this means that your PRTG must be able to send emails to the outside world).

Having trouble with this feature? You can also open a support ticket on the Paessler website!!

Please note: Support communication can be provided in English or German only!

#### ASK A QUESTION OR GIVE US YOUR FEEDBACK

Your Ticket ID PAExxxx  
(if you have one)

Your Email Address  
john.q.public@example.com

Scope of your question

- ☐ PRTG configuration and usage
- ☐ PRTG clients (Enterprise Console and mobile apps)
- ☒ Technical issues (performance, webserver, sensors, probes, cluster)
- ☐ Critical issue (large parts of my monitoring do not work)
- ☐ Other (including feedback and feature requests)

**Tech Support Resources that may be helpful for you:**

- Troubleshooting PRTG speed/performance problems
- Troubleshooting WMI problems
- Troubleshooting SNMP problems
- Troubleshooting Performance Counter problems
- Monitoring network traffic, Linux, Mac OS

Describe your question in one sentence  
One sentence describing my problem

Do you have any further comments?  
Detailed description of my problem

#### HELP US BY ATTACHING A SCREENSHOT AND/OR SUPPORT BUNDLE

It will be tremendously helpful for us if you attach a screenshot and/or analytical information about your PRTG installation. We call this a 'Support Bundle' and it contains selected log and status files of your PRTG installation which help our team to analyze any issues you may have encountered. The Base Pack contains system status, lists of red and black sensors, core state sensor data, probe health sensor data, and recent log entries (system and probe related), as well as the log files.

Screenshot

- ☒ Do not attach screenshot
- ☐ Create and attach screenshot (recommended)

Submit Cancel

The Contact Support / Feedback Form

### Ask a Question or Give Us Your Feedback

Provide the following information in this section of the contact form:

- **Your Ticket ID PAExxxx:** If you have already opened a new ticket (either directly via email to [support@paessler.com](mailto:support@paessler.com), or via the Knowledge Base, or via the support form on paessler.com), enter its ID here. You can find it in your confirmation email regarding the request we received. You can provide the ID with "PAE" in front or just the number. Otherwise, a new ticket will be created.
- **Your Email Address:** Enter your email address here. You can provide any of your addresses; however, recommended and default is the email address of your PRTG account.

- **Scope of Your Question:** Select a topic regarding your issue and consider the proposed links.
- **Describe Your Question in One Sentence:** Provide short information which indicates the topic of your issue.
- **Do You Have Any Further Comments?:** Leave your comments here. It can be feedback or support questions. Please describe your issue as detailed as possible!

## Attach a Screenshot and/or Support Bundle

In order to provide as helpful information as possible, you can attach a screenshot of the current page and various support bundles with useful analytical data about your PRTG installation.

In section **Screenshot**, choose between:

- **Create and attach screenshot (recommended):** This will create a screenshot of the currently displayed page in PRTG. It will be sent with your ticket. A preview will be shown below the screenshot section. **Note:** If you encounter issues on a specific page in PRTG, call the contact support form on this page in order to get a screenshot of it.
- **Do not attach screenshot:** No screenshot will be taken. **Note:** We recommend to attach a screenshot in order to understand your request easier and faster.

In section **Support Bundle**, you can choose between several packages which differ in coverage of information:

- **Attach Base Pack with log files (recommended):** Contains log files of your PRTG installation and the following information:
  - System status
  - Lists of sensors regarding their current states
  - Core state data
  - Probe Health sensor data
  - Current log entries
- **Attach Base Pack with log files and PRTG configuration file:** Additionally contains the configuration file. **Note:** Send this package only if our support team told you so! This file contains encrypted passwords readable by Paessler support.
- **Do not attach a Support Bundle:** No files will be attached. Choose this option only when sending feedback.

# Part 8

## Enterprise Console

## 8 Enterprise Console

The Enterprise Console (formerly called "Windows GUI") is one alternative [interface](#)<sup>[77]</sup> you can use to connect to the PRTG core server to configure your setup, view monitoring results and keep an eye on your network. It is a native Windows application for fast access to data and monitoring management.

The Enterprise Console provides extended popup window functionalities as well as a seamless link to the [Ajax web interface](#)<sup>[100]</sup> where you can change your monitoring configuration and access further functionalities such as reporting, Maps, system setup, etc. Some of these functionalities are shown with an embedded webkit browser, for others an external browser window is opened.

### Access Several Core Servers in One Console

As an additional functionality, you can configure access to several PRTG core servers in the Enterprise Console. The console will then show data of your independent core server installations at a glance (for example, the device tree and alarms list), so you can manage your monitoring centrally, also when it is spread across different servers.

### Getting Started

With an installation of PRTG Network Monitor, the Enterprise Console is included and installed automatically on the computer running the PRTG core server. If you want to use the Enterprise Console on another computer, please download and install it there, as described in the [Install the Enterprise Console](#)<sup>[67]</sup> section.

**Note:** The Enterprise Console is mainly designed to review and manage an existing installation of PRTG which has already been set up. If you just started monitoring, we recommend you use the [Configuration Guru](#)<sup>[36]</sup> and the web interface's [auto-discovery](#)<sup>[190]</sup> function and add your network's devices there.

For detailed instructions, please see [Quick Start Guide](#)<sup>[32]</sup> section. Once finished, you can seamlessly switch to the Enterprise Console.

### Requirements for Connections to PRTG Web Server(s)

In order to show monitoring data of your PRTG setup, the Enterprise Console must be able to establish a connection to your PRTG web server(s). For this purpose, please ensure the following:

- The following server settings in the Enterprise Console (see section [PRTG Servers](#)<sup>[1927]</sup> for details) have to match the following settings in the [PRTG Server Administrator](#)<sup>[1999]</sup>:

Enterprise Console Server Settings	PRTG Server Administrator Settings
Server IP / DNS name	<b>IP address for PRTG's Web Server</b> on the Web Server tab
Port	<b>TCP Port for PRTG's Web Server</b> on the Web Server tab <b>Note:</b> PRTG switches to port <b>8080</b> as a fallback after a restart when port 80 is already used. Because the EC does not recognize port 8080 automatically, enter this port manually in the EC settings. If you do not get a connection to the PRTG web server, check the currently used port in the <a href="#">Web Server and Website Settings</a> of PRTG's web interface.
Login Name	<b>Login Name</b> on the Administrator tab
Password	<b>Password</b> on the Administrator tab

- No local software firewall blocks the connection
- No local virus protection program blocks the connection
- The specified port is not used by another application
- No (hardware) firewall blocks the connection when connecting through a network (LAN or WAN)
- The software versions of the Enterprise Console and the PRTG web server have to match

See section [More](#) for common issues with the Enterprise Console and their solutions.

## More

Knowledge Base: Problems with the Enterprise Console: What can I do?

- <http://kb.paessler.com/en/topic/60091>

The following sections introduce the features and concepts of the Enterprise Console:

## Enterprise Console—Topics

- [First Start](#)  1897
- [General Layout](#)  1898
- [Menu Tabs and Page Content](#)  1902
- [PRTG Servers](#)  1927
- [Options](#)  1930
- [Windows Menu Structure](#)  1936
- [Context Menus](#)  1941
- [Shortcuts Overview](#)  1942

## Related Topics

- [Ajax Web Interface—Basic Procedures](#)  100
- [Ajax Web Interface—Device and Sensor Setup](#)  188
- [Ajax Web Interface—Advanced Procedures](#)  1726
- [Other User Interfaces](#)  1946

## 8.1 First Start

This section will help you start the Enterprise Console for the first time.

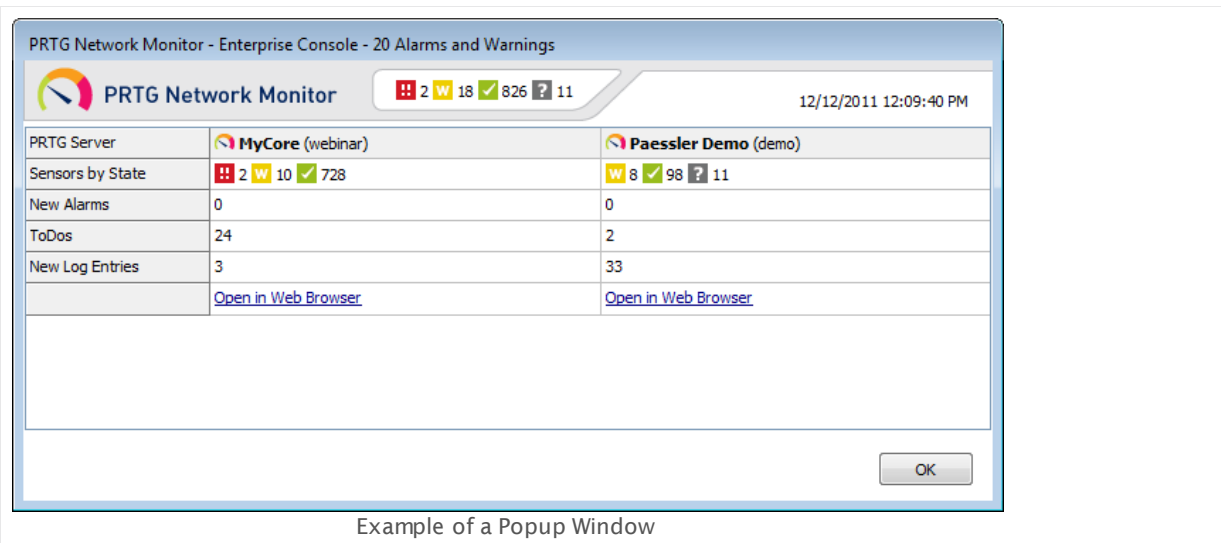

### Opening the Enterprise Console

Double click the **PRTG Enterprise Console** icon in the Windows start menu to open it. As soon as it opens, the Enterprise Console will try to connect to your PRTG installation, according to the given PRTG server connection settings. In a fresh install of PRTG, the settings for the Enterprise Console installed on the computer running the PRTG core server are already predefined, so you can use the Enterprise Console right away. If you get an error message when opening the Enterprise Console, please check the connection settings. For example, editing the settings is necessary in case the IP address of the server has changed.

If you get an error message, please check your connection settings. For detailed information, please see [PRTG Servers](#) <sup>1927</sup> (**PRTG Server Connection**) section.

### Popup Window

By default, the Enterprise Console runs in the background and shows a popup message whenever there are new alerts, new messages, or new tickets for your monitoring. The popup window will be one of the first things you see after opening the Enterprise Console.

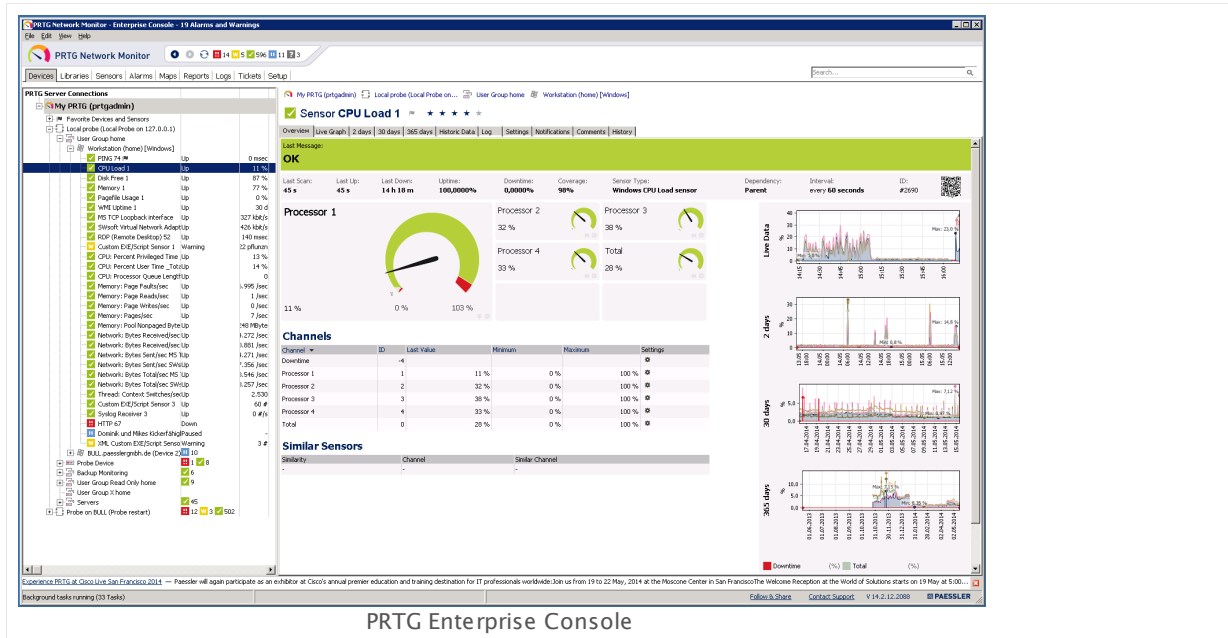

This window is shown as always on top. Click on the **OK** button to close it. You can change the popup behavior in the Enterprise Console settings.

For detailed information, please see [Options](#) <sup>1931</sup> settings (**System—Alerting**).

## 8.2 General Layout

The main layout of the Enterprise Console (EC in short form) program consists of different elements which we describe in this section.

From top to bottom, the main layout consists of:

- The [Windows menu](#)<sup>[1898]</sup>.
- The [page header bar](#)<sup>[1899]</sup> with the PRTG logo, the viewpoint arrow symbols, the refresh icon, and the sensor states overview.
- The [menu tabs bar and page content](#)<sup>[1899]</sup> underneath.
- The [server selection](#)<sup>[1899]</sup> and [search bar](#)<sup>[1900]</sup> in the upper right corner.
- The [news feed](#)<sup>[1900]</sup> underneath the page content.
- The [status bar](#)<sup>[1900]</sup> at the bottom of the window.

Often, data and settings are displayed directly in the Enterprise Console. For some functionalities and extended setup, a new window of the system's default browser will be opened and the [web interface](#)<sup>[1901]</sup> will show up. In this case, you'll be logged in to the web interface automatically via username and [hash value](#)<sup>[1812]</sup>. In your browser, it might be necessary to confirm the certificate used by PRTG's web server. For more information, please see [SSL Certificate Warning](#)<sup>[105]</sup> section. If you configure your Enterprise Console for a connection with more than one PRTG core server, keep an eye on the [server selection](#)<sup>[1899]</sup> bar to choose which server's data you want to access.

### Windows Menu

The Windows menu gives access to general configuration and settings. Find a detailed description in the [Windows Menu Structure](#)<sup>[1936]</sup> section.

## Page Header Bar

Enterprise Console's Page Header Bar

The page header consists of the following parts:

- **PRTG Logo**

Click on the PRTG Network Monitor logo to open the [Ajax web interface](#)<sup>[100]</sup> in the browser configured in the Enterprise Console's [Options](#)<sup>[1930]</sup>. If several PRTG core servers are configured, the browser will load the web interface of the server currently selected in the [Devices](#)<sup>[1903]</sup> tab.

- **Previous Viewpoint / Next Viewpoint (Arrow Symbols)**

The enterprise stores the different views shown while you navigate through the application. Using these arrows (or using the shortcuts **Alt+Left** and **Alt+Right**) you can step back and forth in the history, just as known from your browser.

- **Refresh (Arrow Circle Symbol)**

Click on the refresh symbol (**F5**) any time to refresh the current screen. This will immediately query data for the current screen from all active PRTG core servers, just as the automatic refresh does, which can be configured in the [Options](#)<sup>[1930]</sup> settings.

- **Global Sensor Status Symbols**

This area shows the aggregated status of all sensors from all active PRTG core servers, divided into different sensor states. Depending on the sensors' status you will see colored boxes with numbers which symbolize the sensors. For example, you can see how many sensors are in **Up**, **Down**, **Warning**, **Pause**, **Unusual**, or **Unknown** state. Click on a box to view a list of all sensors in the respective status. For a detailed description, please see [Sensor States](#)<sup>[121]</sup> section.

**Note:** When viewing sensor lists, you can show the sensors of one server at a time only. So, the global sensor overview shows the total number of sensors in a certain status on all active servers, but viewing a list of all sensors in a certain status from all servers is not possible for performance reasons.

## Menu Tabs Bar and Page Content

You can navigate through your setup using the menu tabs bar. Please take a few minutes to familiarize yourself with all menu items. The page content underneath varies dependent on the selected menu tab. It shows various information about your monitored objects. For a detailed description of all tabs, please see the [Menu Tabs and Page Content](#)<sup>[1902]</sup> section.

## Server Selection

Enterprise Console's Server Selection and Search Bar

In the server selection bar you see all active PRTG core server connections which are configured for the current Windows user account (saved in the registry).

The server you select here determines globally which information is shown in all [Menu Tabs](#)<sup>1902</sup> (except the **Devices** tab; the server selection does not apply there). Depending on your selection, **Libraries**, **Sensors**, **Alarms**, **Maps**, **Reports**, **Logs**, **Tickets**, and **Setup** options will be shown for the respective server only.

Select **All PRTG Servers** to show consolidated information for all active PRTG core servers which appear in the list. **Note:** For technical reasons, you cannot show consolidated information from all servers in the **Sensors**, **Setup**, and **Search Results** tab. In order to use those tabs, please decide on a single PRTG core server from the server selection bar.

Select **Manage PRTG Servers** to add or remove [PRTG Servers](#)<sup>1927</sup> from the list, or to edit an existing one.

## Search Bar

Select a single PRTG core server from the [server selection](#)<sup>1899</sup> bar and enter a key word to search the respective server. In the **Search Results** tab, the Enterprise Console will display matching monitoring objects, help topics, and related objects. If you click on a monitoring object (for example, a sensor) in the search results, the Enterprise Console will open this object in the [Devices](#)<sup>1903</sup> tab, showing details in the device tree.

**Note:** If you start another search underneath the results within the **Search Results** tab, this will open a browser window, showing results.

**Note:** If you have configured a connection in the [PRTG Servers](#)<sup>1927</sup> options which uses a [Root ID](#)<sup>1929</sup> other than 0, this setting will be ignored while searching. In this case, **Search Results** for the entire server (starting at Root ID 0) will be shown.

## News Feed Bar

The news feed bar shows latest news by Paessler. Click on the bar to open a popup with an overview about recent articles. You can open a specific article in the web browser by clicking on the particular header or on **More...** If you do not want to show the news feed in your Enterprise Console, click on the **X** besides the bar. You can enable it again via [View](#)<sup>1939</sup> in the main menu.

## Status Bar

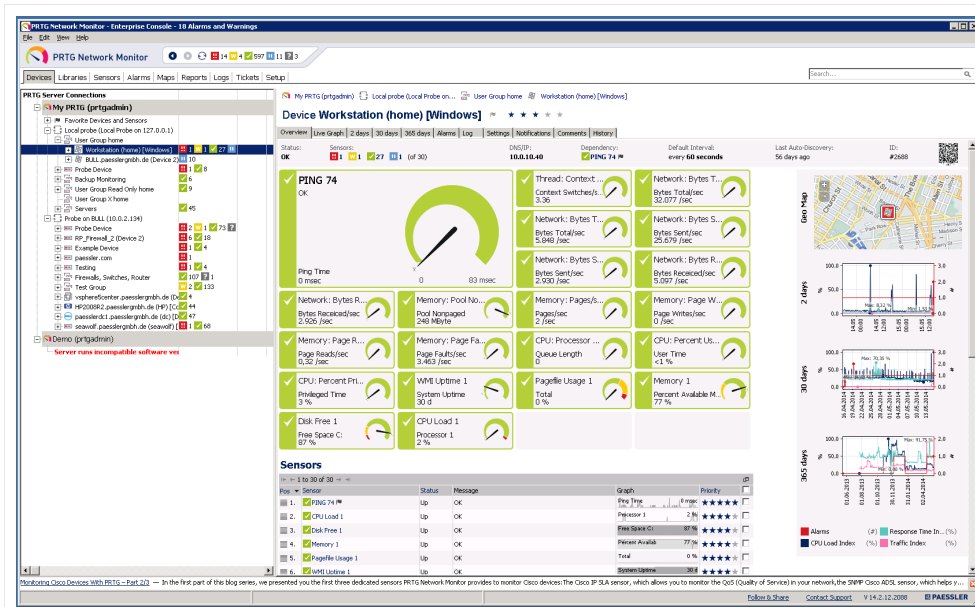

The status bar shows the version number of your PRTG Enterprise Console and the Paessler logo which leads you to the Paessler website when you click on it. Furthermore, the status bar contains a [Contact Support](#)  link which will open a window to leave feedback or to ask for support, and a **Follow & Share** link which opens PRTG's social network contact information in the Ajax web interface.

## 8.3 Menu Tabs and Page Content

Under the different menu tabs of the Enterprise Console you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc.

PRTG Enterprise Console — Device Details

The following sections introduce the available options within the different tabs:

- [Devices](#) <sup>1903</sup>
- [Libraries](#) <sup>1910</sup>
- [Sensors](#) <sup>1912</sup>
- [Alarms](#) <sup>1914</sup>
- [Maps](#) <sup>1916</sup>
- [Reports](#) <sup>1918</sup>
- [Logs](#) <sup>1920</sup>
- [Tickets](#) <sup>1922</sup>
- [Setup](#) <sup>1924</sup>
- [Search Results](#) <sup>1926</sup>

### 8.3.1 Devices

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#) 1903
- [Libraries](#) 1910
- [Sensors](#) 1912
- [Alarms](#) 1914
- [Maps](#) 1916
- [Reports](#) 1918
- [Logs](#) 1920
- [Tickets](#) 1922
- [Setup](#) 1924
- [Search Results](#) 1926

#### Devices Menu Tab

The **Devices** tab will be your starting point for everyday use. The page is split into two parts. On the left hand side, it shows the tree-like device view which lists all configured PRTG core servers with their probes, groups, devices, and the sensors on the devices, in a hierarchical order. Next to each object you see an overview of the number of sensors, grouped by their current status.

The first child node of the tree is called **Favorite Devices and Sensors**. It contains all devices and sensors that are marked as favorites. In order to add an object to the favorites list, right-click on it and select the **Add to Favorites** entry from the [context menu](#) 163. For details, please see [Priority and Favorites](#) 160 section.

**Note:** For more information about the hierarchical order of the different objects in the device tree, please see [Object Hierarchy](#) 83 section.

On the right side you see details about the object selected on the left. The information is spread over several tabs.

## Edit Objects in the Device Tree

Using the **Edit** menu (or the object's [context menu](#)<sup>1941</sup>) you can access different important functions of the items you have currently selected in the device tree on the left hand side, such as

- Add devices or sensors to the favorites list (or remove them from the list)
- Sort all sub nodes of an object alphabetically
- Move objects up and down in the tree
- Check now
- Pause monitoring
- Access tools
- and many more

For details about the available options, please see [Windows Menu Structure](#)<sup>1936</sup>.

## Select Multiple Items in Device Tree

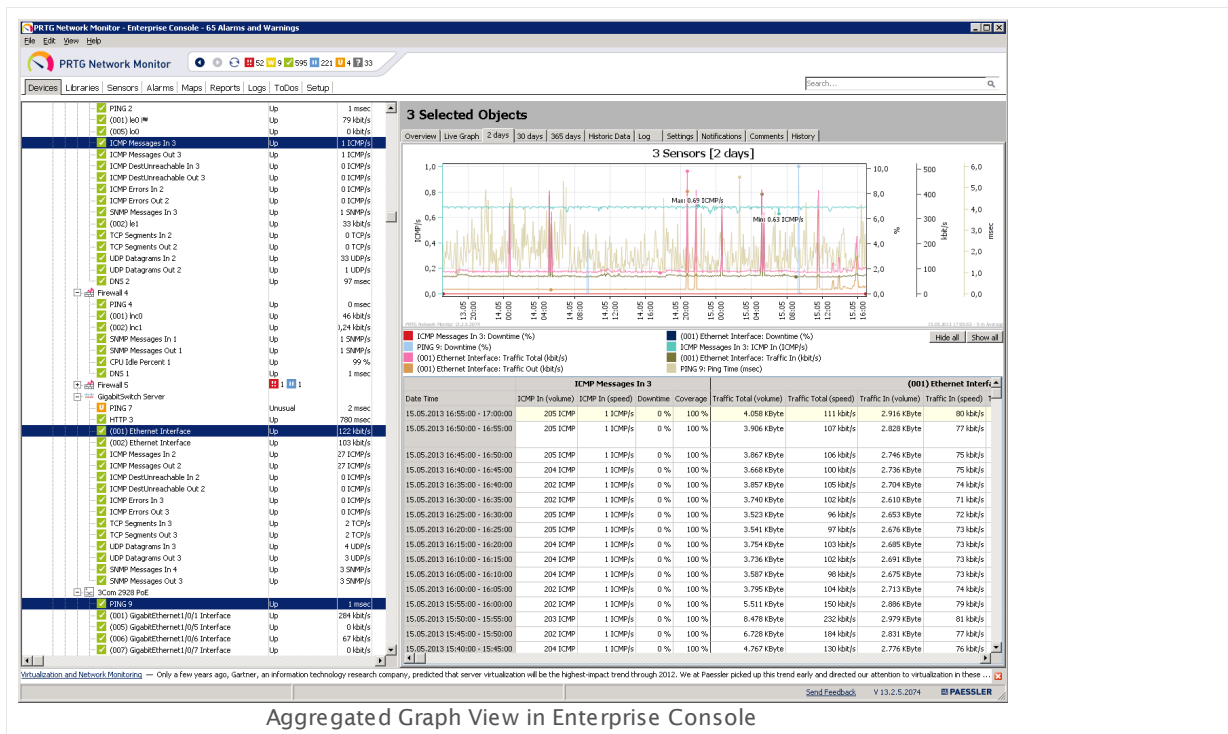

In the device tree shown on the left, you can select one or more objects, even from different PRTG core servers. Hold down the **Ctrl** key to select more objects simultaneously with your mouse. Usually, you will select more than one item in order to view combined graphs, or to apply a command from the [Windows Menu](#)<sup>1936</sup> (for example, **Check Now** or **Pause**) to several objects.

When selecting multiple items, the sub-tabs on the right side will show data for **all** selected items at a glance. For example, when selecting two sensors, you will see their tables next to each other. Graphs will actually be shown combined! This is a great way to instantly show one chart containing the graphs of all selected objects. Each sensor channel will then be shown as one line. This aggregated view works for all kind of objects.

**Note:** The tab **Live Graph** will show data for sensors only.

**Note:** Underneath each graph a legend is shown. Hover an entry in the legend to display the according line in the graph above in **bold**.

## Part 8: Enterprise Console | 3 Menu Tabs and Page Content 1 Devices

Aggregated Graph View in Enterprise Console

**Note:** You may need to enlarge the Enterprise Console's window in order to see all tables and graphs.

### Devices—Overview

The **Overview** tab shows general information about the selected object. Depending on the object selected, different information is displayed.

- For **servers**, **probes**, and **groups** the table shows information in the **Name** section only, such as priority and parent objects. On the right side, a geographical Map is shown, if enabled in your PRTG configuration as well as in the Enterprise Console's [View menu](#) (1939). For detailed information about geographical maps, please see [Geo Maps](#) (1744) section.
- For **devices**, the **Overview** tab shows device details and summary graphs for different time spans, as well as a list of all sensors on this device.
- For **sensors**, the **Overview** tab shows sensor details, current status, and the last value of all sensor channels, as well as sensor graphs for different time spans. You can also edit channel settings in this tab by clicking on a channel's gear icon (for details, please see section [Sensor Channels Settings](#) (1709)).

### Devices—Live Graph, 2 days, 30 days, 365 days

These tabs are only available if the **Large Single Graph (Ctrl+L)** view is enabled in the [Windows Menu](#) (1939) (View). For **Small Multiple Graphs** view please see [Devices—Graph](#) (1906) section below.

Select one of the tabs to display an object's monitoring results as **Live Graph** (content available for sensors only), or for different time spans in more or less detail (**2 days**, **30 days**, **365 days**). In every tab, you will see graphs as well as data tables.

While viewing a sensor graph you can hide single sensor channels individually. Simply remove the check mark symbol in front of a channel name underneath the graph, and the according channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons besides the channel names. The graph view will be reset immediately.

**Note:** The days mentioned here are the default setting. You can change the detail of the different graphs any time in PRTG's web interface under [System Administration—User Interface](#).

**Note:** Underneath each graph a legend is shown. Hover an entry in the legend to display the according line in the graph above in **bold**.

## Devices—Graph

This tab is only available if the **Small Multiple Graphs** (**Ctrl+S**) view is enabled in the [Windows Menu](#) (**View**). For **Large Single Graphs** view please see above. This will show an overview with single graphs and data tables for live data, 2 days, 30 days, and 365 days. It might be necessary to enlarge the window in order to display all graphs. **Note:** The days mentioned here are the default setting. You can change the detail of the different graphs any time in PRTG's web interface under [System Administration—User Interface](#).

**Note:** Underneath each graph a legend is shown. Hover an entry in the legend to display the according line in the graph above in **bold**.

## Devices—Historic Data

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When calling the historic data reports via this tab, there is no sensor selection available, because you have already determined which sensor you would like to create a report for.

The screenshot displays the PRTG Network Monitor interface. At the top, there is a navigation bar with tabs: Home, Devices, Libraries, Sensors, Alarms, Maps, Reports, Logs, Tickets, and Setup. Below this is a sub-navigation bar for the selected device, showing various sensor types like Local probe, Networking, Switches, and HP 2810-24G. A status bar indicates 'New Alarms: 2', 'New Log Entries: 68', and various status icons. The main content area is titled 'Sensor PING 8' with a five-star rating. Below the title, there are tabs for Overview, Live Data, 2 days, 30 days, 365 days, and Historic Data (which is selected). The Historic Data tab shows a form to 'REVIEW OR DOWNLOAD HISTORIC SENSOR DATA'. This form includes fields for Start and End dates (both set to 2013-12-09 11:42), a Quick Range section with buttons for 1 Day, 2 Days, 7 Days, 14 Days, Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, and 12 Months. There is also a dropdown for Average Interval (set to 60 Minutes/1 Hour) and a File Format section with radio buttons for HTML web page (selected), XML file, and CSV file. Below the form, there is a section for 'INCLUDE PERCENTILES' with a radio button for Percentile Results (set to Off). At the bottom of the form are Start and Cancel buttons. The footer of the interface shows the PAESSLER logo, version information (PRTG Network Monitor 13.4.9.3636+ [Canary]), copyright (© 2013 Paessler AG), user information (PRTG System Administrator), refresh interval (Refresh in 591 sec), and a timestamp (10.12.2013 11:42:09).

Historic Data Tab of a Ping Sensor

Depending on the **File Format** option you choose, the results will be shown:

- **HTML web page:** Open a new window, showing the historic data report
- **XML file:** A new browser window will open, showing the historic data report as XML file.
- **CSV file:** A new browser window will open, showing the historic data report as CSV file.

When you click on one of these items, a new window or tab of the external browser configured in the Enterprise Console's [Options](#)<sup>[1934]</sup> will open and PRTG will automatically login and redirect you to the respective web page. If your browser displays a certificate warning, please find more information in the [SSL Certificate Warning](#)<sup>[105]</sup> section.

View and functionality are the same as in the web interface. For details about the available **Historic Data** report options please see [Historic Data Reports](#)<sup>[133]</sup> section of the [Ajax Web Interface](#)<sup>[100]</sup> documentation.

## Devices—Log

Click on the **Log** tab to show a table list with all log information **on this object**. This is a subset of the entries available via the [Logs](#)<sup>[1920]</sup> menu tab.

In the list, one hundred entries are shown at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

## Devices—Settings

In the **Settings** tab the currently selected object's settings are loaded from the web interface and displayed. View and functionality are the same as in the web interface. For every type of object and for every sensor, different options are available. For detailed information, please see the following sections (depending on the selected object) in the [Ajax Web Interface](#)<sup>[100]</sup> documentation:

- [Probe Settings](#)<sup>[238]</sup>
- [Group Settings](#)<sup>[253]</sup>
- [Device Settings](#)<sup>[272]</sup>
- [Sensor Settings](#)<sup>[290]</sup>

## Devices—Settings—Multi-Edit

If you select several objects on the left side, the **Settings** tab will switch into multi-edit mode. Using multi-edit, you can set a check mark for one or more settings. All changes will be applied to all selected objects. The multi-edit dialog displays settings which are common among the selected objects only.

If you select sensors only on the left side, the **Settings** tab will display a new tab row with a **Channel Settings** tab. Using this tab you can multi-edit the settings of any channels which are common among the selected sensors, as long as the channels have the same name. Set a check mark for one or more channel settings. All changes will be applied to all selected sensors.

**Note:** You cannot use multi-edit for objects on different PRTG core servers.

## Devices—Notifications

In the **Notifications** tab the currently selected object's settings are loaded from the web interface and displayed. View and functionality are the same as in the web interface. You can set different notification triggers.

For detailed information, please see the [Sensor Notifications Settings](#)<sup>[1716]</sup> section in the [Ajax Web Interface](#)<sup>[100]</sup> documentation.

**Note:** You cannot change notification settings for multiple objects at a time. We recommend using the [Inheritance of Settings](#)<sup>[87]</sup> for easy configuration.

## Devices—Comments

In the **Comments** tab the currently selected object's settings are loaded from the web interface and displayed. View and functionality are the same as in the web interface.

In the **Comments** tab you can enter free text for each object. This can be used for documentation purposes or to leave information for other users.

## Devices—History

In the **History** tab all changes in the settings of an object are shown with a timestamp, the PRTG user which conducted the change, and a message.

## Drag & Drop Sorting in Device Tree

In the device tree, you can also move probes, groups, and devices simply via drag and drop. Activate it in the [Windows menu](#)<sup>[1936]</sup> **Edit | Drag & Drop Sorting** and then drag your objects as you like: You can move devices and groups, or add groups or devices to other groups. You can also move objects via the [context menu](#)<sup>[1941]</sup>.

**Note:** You cannot move objects in the following cases:

- You cannot move any objects from one PRTG core server to another.
- You cannot move sensors from one device to another. In order to clone sensors to other devices using drag&drop, please use the [Ajax Web Interface](#)<sup>[100]</sup>. For detailed information, please see [Manage Device Tree](#)<sup>[222]</sup> section.
- You cannot move devices from one group to another.
- You cannot move groups from one probe to another.
- You cannot move probes from one core server to another.

### 8.3.2 Libraries

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#) 
- [Libraries](#) 
- [Sensors](#) 
- [Alarms](#) 
- [Maps](#) 
- [Reports](#) 
- [Logs](#) 
- [Tickets](#) 
- [Setup](#) 
- [Search Results](#) 

Using Libraries is a great way to keep an eye on your network's status because you can individually select which sensors you would like to see there. For a general introduction to Libraries, please see [Libraries](#)  section.

#### Libraries Menu Tab

The page is split into two parts. On the left hand side you see all available libraries from one or several servers, on the right hand side the actual libraries are displayed.

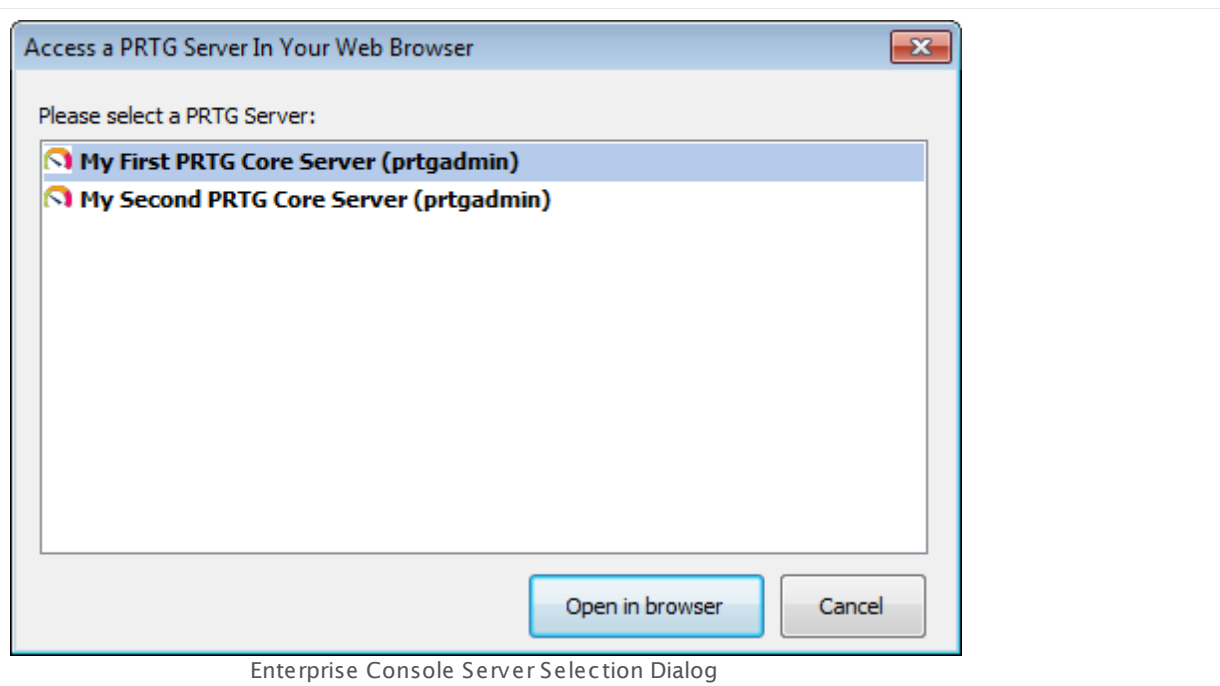

- Single-click on a library's name to display it. In the tabs above the library, select from [Overview](#) , [Management](#) , [Settings](#) , [Notifications](#) , [Comments](#) , and [History](#) . Each of these tabs loads the respective functionality of the [Ajax Web Interface](#) . Please remember to click the **Save** button in order to apply your settings. Please find detailed information in the [Libraries](#)  section.
- Underneath the tabs bar, there are different options available to change the current library view: You can set sensor filters (set or remove check marks to include or exclude sensors in a certain state) and change the device tree view (for details about the tree view, please see [General Layout—Tree View Layout](#)  section).
- Double-click on a library's name to open the library in the configured external web browser. You can edit it or add new libraries on this PRTG server. For more information see [Libraries](#)  section.

- Right-click on a library's name to open a [context menu](#)<sup>1941</sup>. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, and **Open in Web Browser** in the libraries overview on the left, **Details...**, **Edit**, **Remove from Library...**, **Add Library Node...**, **Add Group...**, and **Send Link by Email** on the **Overview** tab of a specific library on the right. For more information see [Libraries](#)<sup>1759</sup> section.

## Libraries Menu Tab—Add Library

Click on the **Add Library** button to add a new library to a core server.

Depending on the current setting shown in the [server selection](#)<sup>1899</sup> bar in the upper right corner, an (embedded) window will be opened immediately (if one specific server is selected), or you will be prompted with a selection window, asking you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a library, please see [Libraries Step By Step](#)<sup>1762</sup>.

### 8.3.3 Sensors

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

Viewing lists of sensors is a great way to keep an eye on your network's status, as you can select which kind of sensors you would like to see. You can filter by object, sensor type, and current sensor state.

#### Sensors Menu Tab

**Note:** For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

Click on the **Sensors** entry in the menu tabs bar to show a table list of all sensors. You can enable a filter to only show certain sensors. To do so, choose from three different drop down menus to build a filter. With each filter you can further decrease the number of sensors shown.

- **By Type**  
The second drop down menu shows all sensor types available in your monitoring setup. Select an entry to only show sensors of this type. The default value is **All Types**.

- **By Status**

The third drop down menu shows all possible sensor states. Select an entry to only show sensors that currently show this status. Choose between **All States**, **Down**, **Down (Acknowledged)**, **Down (Partial)**, **Warning**, **Up**, **Paused**, **Unusual**, and **Unknown**. The default value is **All States**. **Note:** If you click on a sensor symbol in the [page header bar](#), you can directly view a sensor list filtered by the selected sensor state for the selected server.

If you have filtered out all sensors and the list below shows no entries, try removing some filters by reverting them to the default values. To disable all filters, remove the check mark in front of the **Filter by** option at the beginning of the line.

**Note:** In the column **Last Value** only the last value of the sensor's **primary channel** will be shown.

In the list, one hundred entries are shown at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

From this list view, you can select multiple items in order to apply the same action to them, for example, **Edit** | **Check Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while hovering the lines you want to select
- Hold the Ctrl key while clicking to toggle the selection status of a single line
- Click a line and hold the Shift key while clicking another line to select all lines in between.

### 8.3.4 Alarms

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

#### Alarms Menu Tab

In the **Alarms** tab the alarms of **all** active PRTG core servers can be displayed. To do so, select **All PRTG Servers** from the server selection in the upper right corner.

The Alarm list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful to keep track of all irregularities in your network.

Using the options **Error**, **Warning**, and **Unusual**, you can hide and show sensors in the respective status by removing and adding a check mark. When choosing **Error**, this includes sensors in the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

From this list view, you can select multiple items in order to apply the same action to them, for example, **Edit** | **Check Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while hovering the lines you want to select
- Hold the Ctrl key while clicking to toggle the selection status of a single line
- Click a line and hold the Shift key while clicking another line to select all lines in between.

## Acknowledge Alarm

An acknowledged alarm will show up in the alarms list as "acknowledged" (see [Sensor States](#)<sup>121</sup>) and will not [trigger](#)<sup>1716</sup> any more [notifications](#)<sup>1749</sup>. **Note:** If the alarm condition clears, the sensor will usually return into an **Up** status immediately with the next sensor scan.

In order to acknowledge an alarm, right-click on a sensor and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the sensor's last message value. You can choose between: **Acknowledge Indefinitely...**, **acknowledge For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**

If you choose **Until...** a popup window will appear:

Acknowledge Alarm until	
Selected Objects	Shows the sensor(s) for which you want to acknowledge the alarm. You can acknowledge alarms for more than one sensor using <a href="#">multi-edit</a> <sup>1736</sup> .
Message	Enter a text, for example, the reason why you acknowledge the alarm.
Until	Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time. <b>Note:</b> If the alarm condition still persists after the specified date, the sensor will show a <b>Down</b> status again.

Only [users](#)<sup>1856</sup> with write access rights may acknowledge alarms. Read-only users can be given the right to acknowledge alarms, too. See section [User Accounts Settings](#)<sup>1856</sup>, section **Account Control**.

### 8.3.5 Maps

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

#### Maps Menu Tab

The page is split into two parts. On the left hand side you see all available maps from one or several servers, on the right hand side the actual maps are displayed.

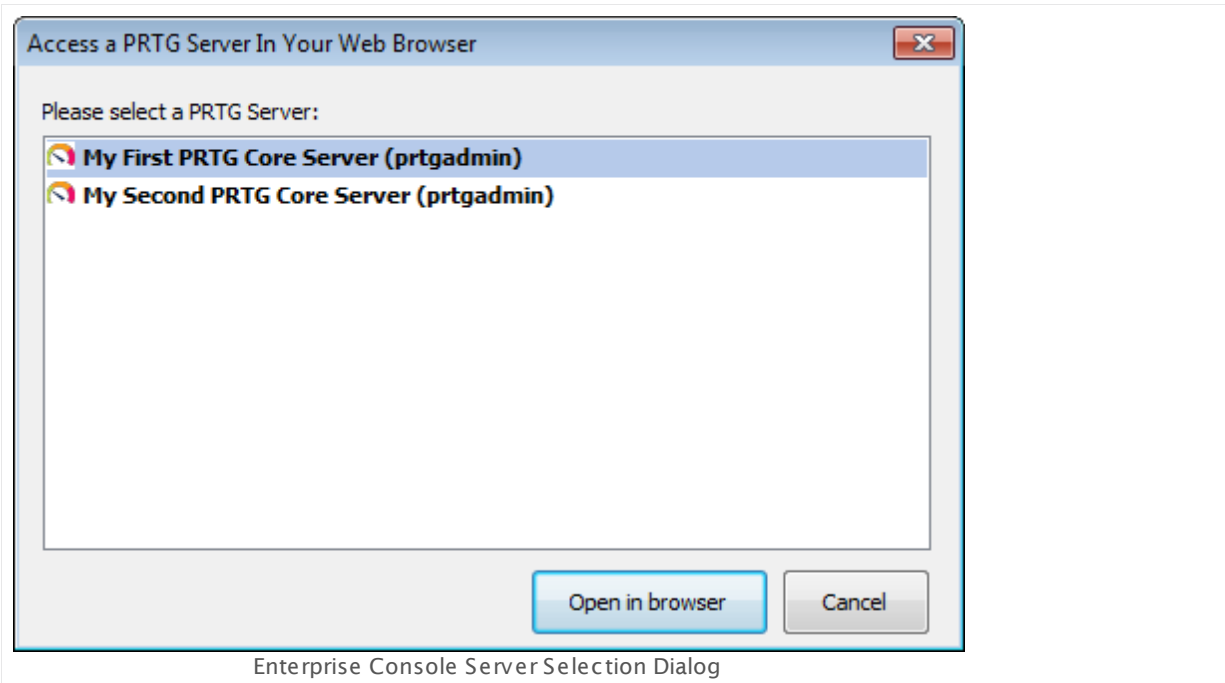

- Single-click on a map's name to display it. In the tabs above the map, select from **View Map**, [Maps Designer](#)  1800, [Settings](#)  1806, [Get HTML](#)  1808, and [Comments](#)  1809. Each of these tabs loads the respective functionality of the [Ajax Web Interface](#)  100. Please remember to click the **Save** button in order to apply your settings. Please find detailed information in the [Maps](#)  1794 section.
- Double-click on a map's name to open the map in the configured external web browser. You can edit it using the [Maps Designer](#)  1800, or add new maps on this PRTG server. For more information see [Maps](#)  1794 section.
- Right-click on a map's name to open a [context menu](#)  1941. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Open in Web Browser**.

#### Maps Menu Tab—Add Map

Click on the **Add Map** button to add a new map to a core server.

Depending on the current setting shown in the [server selection](#) <sup>1899</sup> bar in the upper right corner, an (embedded) window will be opened immediately (if one specific server is selected), or you will be prompted with a selection window, asking you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a map, please see [Maps Step By Step](#) <sup>1797</sup>.

### 8.3.6 Reports

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

#### Reports Menu Tab

In the **Reports** tab you see all available reports from one or several servers, in one list.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

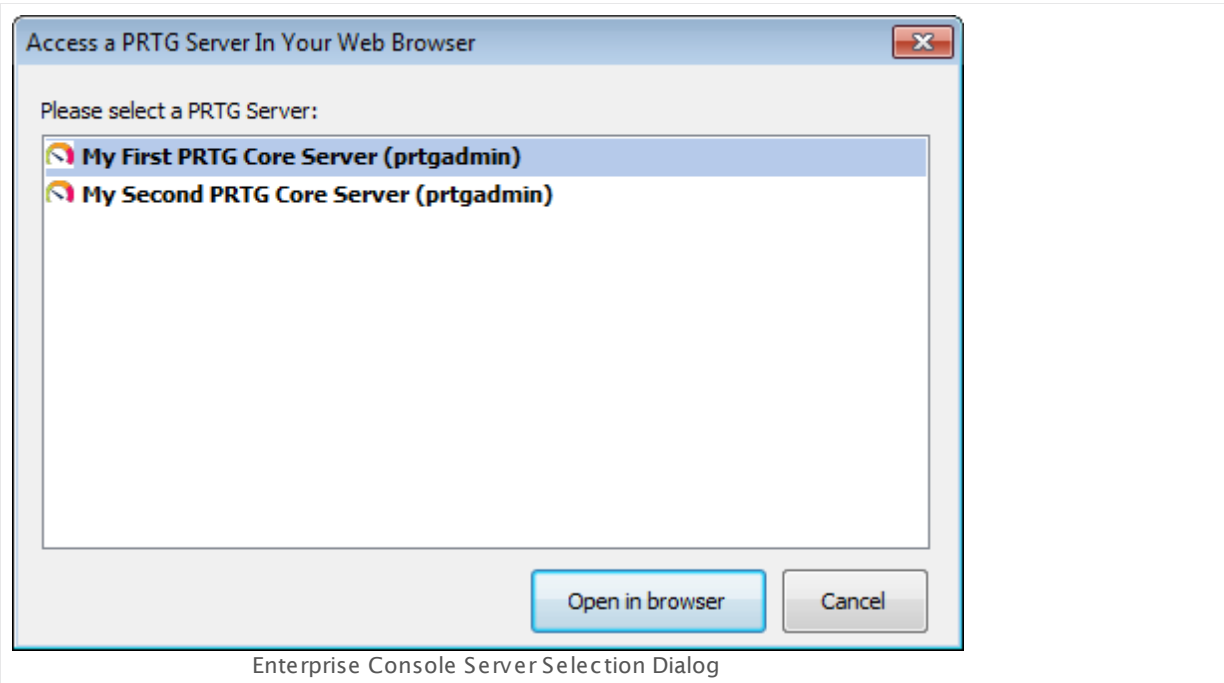

Choose one report and double click on it's name. The page will be split into two parts. On the left hand side you still see all available reports from one or several servers, on the right hand side the options for the currently selected report are displayed.

- Single-click on a report's name to display its options. In the tabs above the report, select from [Run Now](#)  1781, [Stored Reports](#)  1783, [Settings](#)  1784, [Select Sensors Manually](#)  1791, [Sensors Selected by Tag](#)  1793, and [Comments](#)  1793. Each of these tabs loads the respective functionality of the [Ajax Web Interface](#)  100. Please remember to click the **Save** button in order to apply your settings. Please find detailed information in the [Reports](#)  1776 section.
- Right-click on a report's name to open a [context menu](#)  1941. The following options are available: **Add Report**, **Run Now**, **Edit**, **Delete**, **Clone**, **Open in Web Browser**.
- Double-click on any report's name on the left side to return to the initial list view of all reports.

## Reports Menu Tab—Add Report

Click on the **Add Report** button to add a new report to a core server.

Depending on the current setting shown in the [server selection](#) <sup>1899</sup> bar in the upper right corner, an (embedded) window will be opened immediately (if one specific server is selected), or you will be prompted with a selection window, asking you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a report, please see [Reports Step By Step](#) <sup>1778</sup>.

### 8.3.7 Logs

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

The Logs list shows all past activities and events of your PRTG monitoring setup. This is useful to keep track of all important activities and, for example, to check whether messages were sent, etc. In a typical setup, a huge amount of data is produced here. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected.

There are two possibilities to call the logs list: Either you click on the **Log** tab while viewing an object's details in the [Devices](#)  1907 menu tab, or you choose the **Logs** entry from the menu tabs bar.

#### Logs Menu Tab

Click the **Logs** entry in the menu tabs bar to show a list of **all** log entries of a PRTG core server.

You can either view the entries of one or all servers. If you have configured more than one PRTG core server and you want to view entries from all servers in your [PRTG Servers](#)  1927 setup, simply select **All PRTG Servers** from the server selection in the upper right corner.

The sensor status icon in the **Sensor** column shows the [status](#)  121 of an affected sensor. It is green for **Up**, yellow for **Warning**, red for **Down**, and no icon for all other values.

You can enable a filter to only show certain log entries of a certain event. The drop down menu shows all possible event types. Select an entry to only show events of the respective event type. Choose between **All Events**, **Up & Down**, **Down**, **Warning**, **Unusual**, **Up**, **Paused & Resumed**, **Probe Related**, **Auto Discovery**, **Notifications**, and **Status Messages**. The default value is **All Events**.

If you have filtered out all sensors and the list below shows no entries, try another filter or revert to **All Events**.

In the list, one hundred entries are shown at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

### 8.3.8 Tickets

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

#### Tickets Menu Tab

In the **Tickets** tab you can view all tickets on the currently selected PRTG core server. **Note:** You can only display tickets from one server at the same time, not from all PRTG servers.

In the header bar of the tickets list, you can choose several filters to find and display certain tickets: by status, type, concerned user or user group, related monitoring objects, and last edit. Click on the **X** to undo the date selection.

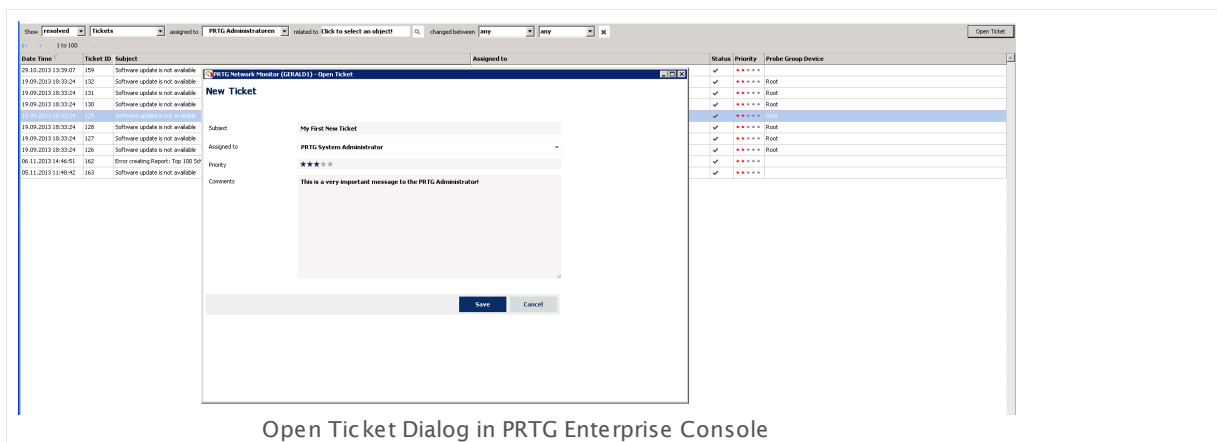

**Double-click** an entry in the tickets list to open a ticket in a popup window and to conduct ticket related actions (edit, assign, resolve, close, or reopen). You can also multi-edit tickets via the context menu: mark several tickets by holding **Ctrl** or **Shift** and clicking on the corresponding tickets. **Right-click** a ticket to open the context menu. The following actions are available: **Open Ticket**, **Edit Ticket**, **Assign Ticket**, **Resolve Ticket**, **Reopen Ticket**, **Close Ticket**, **Priority/Favorite**, **Open in Web Browser**.

#### Tickets Menu Tab—Open Ticket

In order to open a new ticket, click on the **Open Ticket** button in the upper right corner or in the context menu. Select a related object, click on **Continue**, and provide **Subject**, **Assigned to**, **Priority**, and **Comments**. Once finished, click on **Save** and the ticket will be created.

## Part 8: Enterprise Console | 3 Menu Tabs and Page Content

### 8 Tickets

Open Ticket Dialog in PRTG Enterprise Console

For details about working with PRTG's ticket system, please see section [Tickets](#)<sup>149</sup> for PRTG's web interface.

### 8.3.9 Setup

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

#### Setup Menu Tab

**Note:** For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

In the **Setup** tab you can access all options available in the [Setup](#)  1810 menu of the Ajax web interface. Please note that settings for user accounts and user groups are arranged a little different in the Enterprise Console. You can collapse resp. expand the sections by clicking on the - resp. + symbol.

For more information please refer to the respective section in the web interface's documentation.

#### Account Settings:

- [My Account](#)  1812
- [Notifications](#)  1817
- [Schedules](#)  1827

**System Administration:**

- [User Interface](#) 
- [Monitoring](#) 
- [Notification Delivery](#) 
- [Core & Probes](#) 
- [Administrative Tools](#) 
- [Cluster](#)  (available in a [cluster](#)  setup only)

**User Accounts:**

- You see a list of configured user accounts. Select one to change settings. For details, please see [User Accounts](#)  section.

**User Groups:**

- You see a list of configured user groups. Select one to change settings. For details, please see [User Groups](#)  section.

**PRTG Status:**

- [System Status](#) 
- [Cluster Status](#)  (available in a [cluster](#)  setup only)
- [Auto Update](#) 

**Optional Downloads and Add-Ons:**

- [Client App for Windows \(Enterprise Console\)](#) 
- [Client Apps for Mobile Devices](#) 
- [Remote Probe Installer](#) 

**Support:**

- [Contact Support](#) 

### 8.3.10 Search Results

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network's status, monitoring results, etc., as well as access maps, reports, and settings.

There is documentation available for the following tabs:

- [Devices](#)  1903
- [Libraries](#)  1910
- [Sensors](#)  1912
- [Alarms](#)  1914
- [Maps](#)  1916
- [Reports](#)  1918
- [Logs](#)  1920
- [Tickets](#)  1922
- [Setup](#)  1924
- [Search Results](#)  1926

#### Search Results Menu Tab

**Note:** For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

The **Search Results** tab is only visible if you did a search using the search box in the upper right corner. For your search, all matching objects on one PRTG core server are shown. Click on a monitoring object in the results to show it in the Enterprise Console's [Devices](#)  1903 tab.

Other objects, for example, chapters from the help file, are loaded in an external browser.

When you click on one of these items, a new window or tab of the external browser configured in the Enterprise Console's [Options](#)  1934 will open and PRTG will automatically login and redirect you to the respective web page. If your browser displays a certificate warning, please find more information in the [SSL Certificate Warning](#)  105 section.

## 8.4 PRTG Servers

The Enterprise Console connects to the web server API running on every PRTG core server installation. It supports saving the configuration for a connection to one or more PRTG core servers. In a full PRTG installation, there is already a connection predefined.

**Note:** For a successful connection, the program versions of Enterprise Console and PRTG core server have to match. When connecting to several servers please make sure they all run on the same software version.

### PRTG Servers List

From the main menu, select **File | Manage PRTG Server Connections** to view a list of all servers configured for the currently logged in Windows user account. You can also access this list by clicking on the **PRTG Server Connections** entry above the device tree.

#### All PRTG Server Connections

+ Add PRTG Server Connection  
 Delete PRTG Server Connection  
 Move Up  
 Move Down

Active	PRTG Server	Status	Background Activity	Core Version
<input checked="" type="checkbox"/>	My PRTG (prtgadmin)			14.2.12.2088
<input checked="" type="checkbox"/>	Demo (prtgadmin)			14.2.12.2088+

PRTG Servers List in the Enterprise Console

The list shows the server or display name, as well as login information used. In the **Status** column you see an overall sensor status for this server connection. If there is any **Background Activity** on the respective server, which can potentially affect performance and response times, this is displayed as well.

In the list, set a check mark for every PRTG server you want to poll with every update interval. If a server is not reachable, the Enterprise Console will deactivate it automatically after several unsuccessful connection attempts. When opening the Enterprise Console, it will automatically re-establish the connection to all active servers.

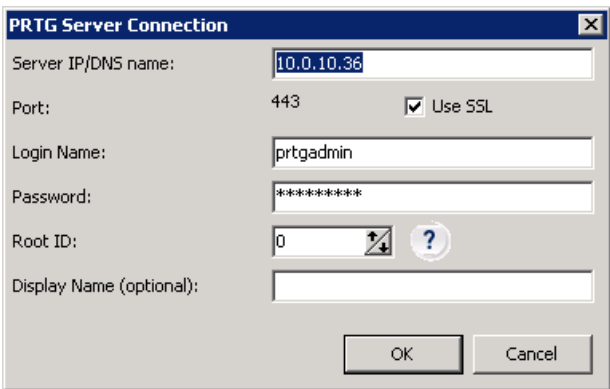

### Add or Edit a PRTG Server Connection

In the header bar above the server list, click on **Add PRTG Server Connection** to add a new server connection configuration. Use **Delete PRTG Server Connection** to remove an entry from the list. With **Move Up** and **Move Down** you can change the order of the servers on the **Device** tab. There is also a [context menu](#)<sup>1941</sup> available for each server connection with the options to **Add** a server, to **Edit** or to **Delete** a server, to open the server in the Ajax web interface, as well as **Move Up** and **Move Down**.

In order to change the settings of an existing server in the list, open its context menu with **right-click** and click **Edit** or click on the respective screwdriver symbol in the table. You can alternatively use the context menu of a server on the **Devices** tag: There you can choose between **Edit PRTG Server Connection** (opens the edit dialog), **Deactivate PRTG Server Connection** (this server's monitoring data will not be shown in the Enterprise Console anymore; you can activate it again later in the servers list), or **Manage PRTG Server Connections** (opens the [PRTG Servers List](#)<sup>[1927]</sup>).

When adding or editing, a dialog box will appear, allowing you to enter connection information.

**Note:** Connection settings are stored for each Windows user individually in the registry under the following node: `HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI`

PRTG Server Connection Settings in Enterprise Console

### Server IP/DNS name

- Enter the IP address or DNS name of the PRTG web server the Enterprise Console will connect to.
- This is the same address or name as defined in the web server settings for the core server. For detailed information please see [PRTG Server Administrator](#)<sup>[1999]</sup> (**Web Server**) section. Please make sure that the set values match.
- Please make sure that the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings are blocking the connection.

### Port

- Enter the port on which the PRTG web server is running.
- This is the same port as defined in the web server settings for the core server. For detailed information please see [PRTG Server Administrator](#)<sup>[1999]</sup> (**Web Server**) section. Please make sure that the set values match.
- Please make sure that the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings are blocking the connection.

### Login Name

- Enter the login name that will be used to login to the web server.

- This can be the administrator login or the login of another PRTG user.
- In a new installation, the login name is **prtgadmin** by default.
- For detailed information about user accounts please see [System Administration—User Accounts](#) <sup>1856</sup> section.

### Password

- Enter the password for the login name entered above.
- In a new installation, the password is **prtgadmin** by default.

### Root ID

- Enter the ID of the object that will be considered the root of the device tree.
- Default value is **0**, which is the Root group of your configuration.
- If you enter an other object's ID here, the device tree will start at this object, only showing all other objects below in the hierarchy.
- This is useful to only view a part of the device tree, which is loaded much faster.
- You can create several connections that only differ in the **Root ID** value in order to quickly switch between different views within your configuration, choosing different PRTG core server connections in the Enterprise Console's [Devices](#) <sup>1900</sup> tab.

### Display Name (optional)

- Optionally enter a name that will be displayed in the **Server** list.
- If you leave this field blank, the **Server IP/DNS name** setting will be displayed there.

Click the **OK** button to save your settings.

## 8.5 Options

From the [Windows menu](#) <sup>1930</sup> of the Enterprise Console, select **File | Options...** to open the settings dialog.

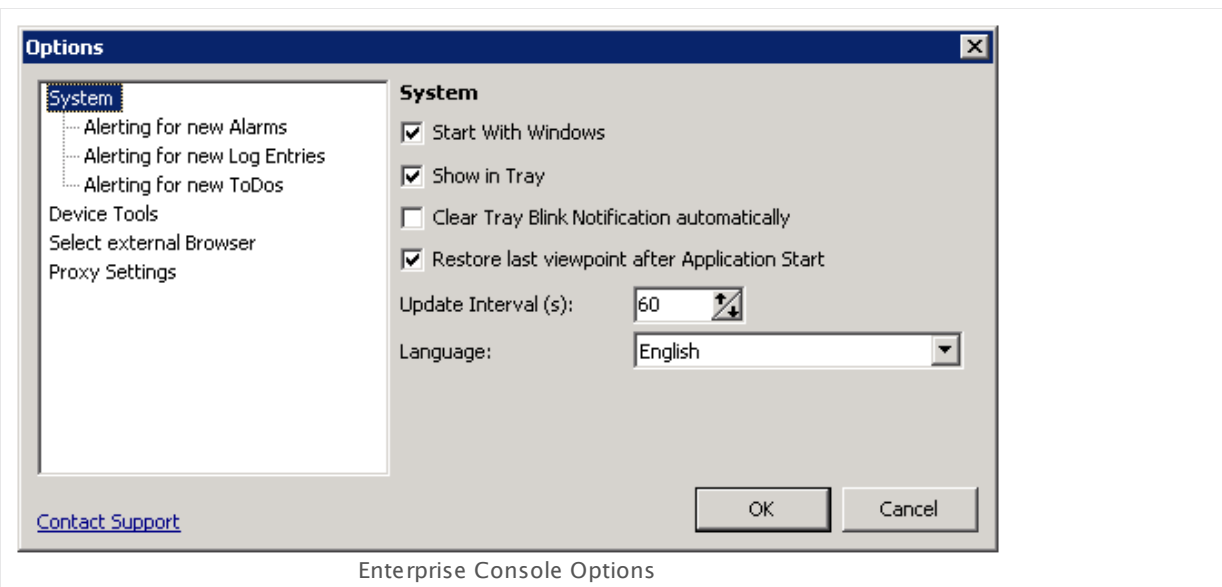

You can choose from these options on the left hand side:

- [System](#) <sup>1930</sup>
- [System—Alerting](#) <sup>1931</sup>
- [Tools](#) <sup>1932</sup>
- [Select External Browser](#) <sup>1934</sup>
- [Proxy Settings](#) <sup>1935</sup>

### System

From the [Windows menu](#) <sup>1930</sup> of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

Change general system settings for the Enterprise Console.

#### Start With Windows

- By default this setting is enabled.
- With this setting enabled, the Enterprise Console will start up automatically when this computer is started.

### Show in Tray

- By default this setting is enabled.
- With this setting enabled, a PRTG icon will be shown in the Windows tray.
- On mouse over, it will show a balloon info with the most important status information about your monitoring; with a right-click you can access a menu with access to the most important functions.
- In order to use any alerting functionalities (see [System—Alerting](#)<sup>1931</sup> section), you must enable this option. If the tray icon is not shown, no alerting from the Enterprise Console will be available.

### Clear Tray Blink Notification automatically

- Whenever there are new entries in the [Alarms](#)<sup>1914</sup> list, the tray icon will start blinking. If you enable this option, the tray icon will stop blinking automatically as soon as there are no more alarms.
- With this option disabled, it will keep blinking, even if all alarms should be cleared meanwhile.

### Restore last Viewpoint after Application Start

- If this option is enabled, the Enterprise Console saves information about the currently shown view (for example, sensor details, a certain graph, or a Map). It is written to the [registry](#)<sup>1935</sup> when you close or exit the program. When you open the Enterprise Console again, it will try to restore the same view.
- Only if the object is not available any more (due to changes on the server, or due to unavailability of a server), the default view will be loaded.

### Update Interval (s)

- Define the number of seconds that will be waited before the screen is refreshed.
- Default value is **60**.

### Language

- Choose the language for this program from the drop down menu. Default is **English**. Depending on your installation, you may be able to choose other languages here.
- This setting will influence the language of the Enterprise Console only.

## System—Alerting

From the [Windows menu](#)<sup>1936</sup> of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

You can define what the Enterprise Console will do in case of new **Alarms**, **Log Entries**, or **ToDos**. The settings are the same for all of these three cases, but you can individually define them for each case. On the left side, please select either **Alerting for new Alarms**, **Alerting for new Log Entries**, or **Alerting for new ToDos** and define the settings as follows.

**Note:** All alerting options only take effect when the **Show in Tray** option is enabled in the [system](#) settings above; if the tray icon is disabled, there will be no alerting from the Enterprise Console.

### Blink Tray Icon

- The tray icon will blink if there are new items to be alerted for.
- You can additionally set the **Clear Tray Blink Notification automatically** option in the [system](#) settings above.

### Balloon Info in Tray

- Show a balloon info next to the PRTG tray icon if there are new items to be alerted for.

### Popup Message

- Show a popup message window if there are new items to be alerted for.
- **Note:** The popup window will be always on top until it's closed.

### Play Sound

- Play an audible notification if there are new items to be alerted for.
- There is a default sound defined. To change it, please click on the folder symbol and select any standard WAV file from your hard disk drive. PRTG already comes with a small set of sounds you can choose from.
- **Note:** The sound file will be played only on the computer running the Enterprise Console.

### Open GUI

- Open the Enterprise Console if there are new items to be alerted for.

### Device Tools

From the [Windows menu](#) of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

In the **Device Tools** settings you can define commands that will be available in the [Windows Menu](#) and [context menu](#) of groups, devices, and sensors. A command to initiate a remote desktop connection is already predefined.

**Note:** In order for the tool function to work with your Windows version, you may need to run the Enterprise Console as administrator.

Please click the **Add** button to add a new command, or choose an existing one from the list and click the **Edit** button to change the settings. Use the **Delete** button to remove an entry from the list.

### Name

- Enter a custom name for your command as it will show up in the context menu.

### Command

- Enter the command you want to execute on the local machine.
- This can be, for example the name of a program or script, with or without path, according to your system's configuration.

### Parameters

- Enter the parameters with which the command will be called.
- You can use the placeholders (variables) shown in the window. Other placeholders are **not** possible. During runtime, these placeholders will be replaced by the respective values set for the object you have selected. For example, the **%id** placeholder will be replaced by the ID of a group, a device, or a sensor, depending on which object you're executing the command for.

### Parameters—Available placeholders

The following placeholders (variables) are available in the Enterprise Console.

Placeholder	Available For Groups	Available For Devices	Available For Sensors	Will Be Resolved To
%id	X	X	X	The object's <b>ID</b> as shown in brackets behind the name
%name	X	X	X	The object's <b>Name</b> value.
%host	—	X	X	The sensor's or device's <b>IP Address/DNS Name</b> value
%message	—	—	X	The sensor's <b>Last Message</b> value
%value	—	—	X	The sensor's <b>Last Result</b> value
%type	—	—	X	The sensor's <b>Type</b> value

If a placeholder is used in combination with an object it is not available for, it will simply not be resolved, but the placeholder itself will be returned.

**Note:** To see the output of all placeholders for different objects you can create a simple test tool that displays the output in a command line window. Just create a tool with the command **cmd** and the following content in the **Parameters** field:

```
/K echo.id: %id && echo.name: %name
    && echo.host: %host && echo.message: %message
    && echo.value: %value && echo.type: %type
```

Then, click an object in the device tree and run the tool from the **Tools** option in the menu (either [Windows](#)<sup>1936</sup> or [context menu](#)<sup>1941</sup>).

### Shortcut

- Select a key shortcut for the command. Choose an F-Key from the list or select **None** to not use a key.

### Select External Browser

From the [Windows menu](#)<sup>1936</sup> of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

With these settings you can define which browser the Enterprise Console will use when you select a command which requires opening an external browser window, for example when calling **View | Open Web GUI...** You can only select browsers installed on the system running the Enterprise Console; other browser options are disabled.

By default, the system's default browser is opened. To change the Enterprise Console's behavior, choose between:

- **Use system default browser (browser.exe)**
- **Use IE (Version: x)**  
**Note:** Only Microsoft Internet Explorer 10 or 11 is supported by the Ajax web interface! Please do not use it with Internet Explorer 9 or earlier! We recommend using Google Chrome 34 or later (recommended) or Mozilla Firefox 28 or later as external browser.
- **Use Firefox (Version: x)**
- **Use Chrome (Version: x)**
- **Use Safari (Version: x)**

## Proxy Settings

From the [Windows menu](#)<sup>1936</sup> of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

If the connection to the PRTG core servers requires a proxy connection, you can set it here.

Choose between:

- **No Proxy**  
Use a direct connection to the servers.
- **Use System Settings**  
Use your Windows default settings, configured in Internet Explorer. To view these settings, open the Internet Explorer on your system and select **Tools | Internet Options** from the menu. Select the **Connections** tab and click on the **LAN settings** button.
- **Manual Proxy Configuration**  
Manually enter a proxy configuration. Please enter the IP address/DNS name of the proxy, a port number, as well as username and password (if required by the proxy). **Note:** Only basic authentication is available!

## Settings Storage

For each individual Windows user account, the settings of the Enterprise Console are stored in the Windows registry. For details, please see [Data Storage](#)<sup>2074</sup>.

## 8.6 Windows Menu Structure

The Windows menu of the Enterprise Console has four main menu items:

- [File](#) 
- [Edit](#) 
- [View](#) 
- [Help](#) 

### File

- **Manage PRTG Server Connections**  
Show a list of all configured PRTG core server connections. For detailed instructions, please see [PRTG Servers](#)  settings.
- **Options...**  
Open the dialog to set options and to configure one or more PRTG core server connections. For detailed instructions, please see [Options](#)  settings.
- **Close or Exit**  
This menu item appears as either **Close** or **Exit**, depending on whether the tray icon is enabled or disabled in the [Options](#)  settings. **Close** will close the Enterprise Console, but alerting will still be available via the tray icon. You can also double click on the tray icon to re-open the Enterprise Console. **Exit** will completely shut down the Enterprise Console. This option is only available if the tray icon is not running.
- **Close and Exit**  
This menu item is only shown if the **Show in Tray** option is enabled in the [Options](#)  settings. It will completely shut down the Enterprise Console and tray icon, so no tray alerts are shown any more.

### Edit

The content of the **Edit** menu varies, depending on whether and which objects are selected within the [Devices](#) , [Sensors](#) , or [Alarms](#)  tab.

**Note:** Some of the options will open the Ajax web interface.

When you click on one of these items, a new window or tab of the external browser configured in the Enterprise Console's [Options](#)  will open and PRTG will automatically login and redirect you to the respective web page. If your browser displays a certificate warning, please find more information in the [SSL Certificate Warning](#)  section.

- **Check Now**  
This will perform an immediate scan for the selected object.
- **Detail**  
This will call the overview tab for the selected object.

- **Edit**  
Here you can access the pages for editing **Settings...**, **Notifications**, **Access Rights...**, and **Management** (not for sensors) of the selected object. In addition, you can **Rename...** this object.
- **Add Group...**  
This option is available only when a probe or group (not the **Root** group) is selected. This will open the Ajax web interface which guides you through adding a new group to the selected probe or group. For detailed instructions, please see [Add a Group](#)<sup>[205]</sup>.
- **Add Auto-Discovery Group...**  
This option is available only when a probe or group (not the **Root** group) is selected. This will open an assistant which guides you through adding such a group. For detailed instruction, please see section [Auto-Discovery](#)<sup>[190]</sup>.
- **Add Device...**  
This option is available only when a probe or group (not the **Root** group) is selected. This will open the Ajax web interface which guides you through adding a new device to the selected probe or group. For detailed instructions, please see [Add a Device](#)<sup>[211]</sup>.
- **Add Sensor...**  
This option is available only when a device is selected. This will open the Ajax web interface which guides you through adding a new sensor to the selected device. For detailed instructions, please see [Add a Sensor](#)<sup>[220]</sup>.
- **Run Auto-Discovery**  
This option is available only when a device is selected. If you select this option, an automatic search is started, adding new sensors to the selected device. The search is running in the background. If found, you will see new sensors after a few minutes automatically. For more information, please see [Auto-Discovery](#)<sup>[191]</sup> (**Run Auto-Discovery Now**).
- **Create Device Template...**  
This option is available only when a device is selected. This will open the Ajax web interface which guides you through creating a device template; this will then be available in [auto-discovery](#)<sup>[190]</sup>. For detailed instructions, please see [Create Device Template](#)<sup>[1741]</sup>.
- **Sort Alphabetically**  
This option is available only when a probe, a single group, or a device is selected. This will sort direct children of the selected node such as groups, devices, or sensors in alphabetical order. The ordering will be stored in the monitoring configuration and cannot be revoked.
- **Check Now**  
For all selected objects from the device tree (use the **Ctrl** key to select multiple objects), perform an immediate scan. This will poll all selected devices and query new data for all sensors on them. If you choose this option for a probe or a group, data for all sensors in the [object hierarchy](#)<sup>[83]</sup> underneath will be queried.
- **Acknowledge Alarm...**  
This option is available only when a sensor in a **Down** or **Down (Partial)** status is selected. For details on how to acknowledge an alarm, please see [Alarms](#)<sup>[1915]</sup> section.
- **Delete**  
This will delete the selected object(s). You will be asked for confirmation before anything is actually deleted.
- **Clone...**  
This option is available only when a single group, device, or sensor is selected. This will open the Ajax web interface which guides you through cloning the selected object. For detailed instructions, please see [Clone Object](#)<sup>[1734]</sup>.

- **Move >**

This will move the selected object(s) of the device tree (use the **Ctrl** or **Shift** key to select multiple objects). Choose between **Top**, **Up**, **Down**, and **Bottom** to move the object(s) to the top or bottom of the mother node, resp. one entry up or down. If you have selected several objects which are not neighbors to move them, then the first object in the list will be moved up resp. down and the others will be attached below this object. You can also move the selected object(s) to another group with **To Other Group...** A popup will appear in this case with information about the selected object and the sub-objects which will also be moved. Please choose a target group from the list. **Note:** Please see section [Devices](#)<sup>[1909]</sup> for details about allowed movements.

- **Pause >**

For all selected objects from the device tree (use the **Ctrl** key to select multiple objects), you can pause and resume monitoring, or set a sensor to error for testing purposes. **Hover** to see available options. You can choose between: **Pause Indefinitely**, **Resume** from pause, **pause For 5 Minutes**, **For 15 Minutes**, **For 1 Hour**, **For 3 Hours**, **For 1 Day**, **Pause Until...**, or **Set Sensor to Error**. The last option only takes effect when a sensor is chosen. If you choose **Pause Until...** a popup window will appear where you can define a date. Monitoring will be resumed after this date. You can also set up a **One-time maintenance window**: enter start and end date of the maintenance in the appearing popup window. You can also use the **date-time picker** for this purpose.

- **Rename...**

Rename the selected object. A popup will appear. Please enter a new name and confirm with the **OK** button.

- **Priority/Favorite >**

With this option you can set the priority for any object and you can add devices and sensors to favorites. For details, please see section [Priority and Favorites](#)<sup>[160]</sup>.

- **Historic Data >**

This will open the historic data tab of the selected object. You can choose between **Last 2 days...**, **Last 30 days...**, and **Last 365 days...**, or when selected one sensor **Live Data...** and **View Historic Data...**. You can also create a report. For detailed instructions, please see [Historic Data Reports](#)<sup>[134]</sup> (**Menu**). When selected one or more sensors (hold the **Ctrl** or **Shift** key to select multiple items), it is possible to call the [Compare Sensors](#)<sup>[130]</sup> function. The graphs of all chosen sensors will be added to comparison automatically. You can add additional sensors in the appearing comparison dialog.

- **Drag & Drop Sorting**

In order to use the option to sort all objects in the device tree via drag and drop, please enable this option. By default, this option is disabled to avoid accidental moves of objects. In this case, a dialog box appears when you try to drag an object. You can disable the dialog box message by clicking the respective check box which is shown together with the message. For details, please see section [Devices](#)<sup>[1909]</sup>.

- **Device Tools** ›

Call a tool command. All placeholders (variables) configured in a tool command will be resolved for the currently selected object. **Hover** to see all available tools configured in your [Options](#)<sup>1932</sup> settings (**Device Tools**). By default, a **Remote Desktop** tool is pre-configured which tries to initiate a remote desktop connection to the IP address or DNS name of the selected object (this will usually work for devices, of course). You can also add a device tool directly to the selected object: **Add Device Tool...** will open [Options—Device Tools](#)<sup>1932</sup>.

For devices, additional options are available. They allow you to connect to the **Service URL** value defined in the device's [settings](#)<sup>1908</sup>, or open the **IP address/DNS name** of the device via the protocols **HTTP**, **HTTPS**, and **FTP**. For each of these functions, your system's default programs will be used. Usually, this is your browser. You can also install a remote probe on a device via [Remote Probe Quick Setup](#)<sup>2053</sup>.

**Note:** In order for the tool function to work with your Windows version, you may need to run the Enterprise Console as administrator.

- **Send link by email**

You can send the link to the selected probe by email. This will open a new email using your system's standard email client. It will contain a direct link to the selected probe's details page.

- **Open in Web Browser**

This will open the currently selected object in the Ajax web interface. This option is not available if multiple objects are selected. The default browser can be set in the [Options](#)<sup>1934</sup> settings. **Note:** This option is available in the [Context Menus](#)<sup>1941</sup> and under [View](#)<sup>1939</sup>.

## View

- **Refresh**

This will immediately query data for the current screen from the PRTG core server, just as the automatic refresh does, which can be configured in the [Options](#)<sup>1930</sup> settings.

- **Open Web GUI...**

This will open the start page of the Ajax web interface in the external browser. The default browser can be set in the [Options](#)<sup>1934</sup> settings.

- **Large Single Graph**

Change the view in [Devices](#)<sup>1908</sup> menu tab to large single graphs. This will display live graphs, and graphs for three other time spans, in different tabs.

- **Small Multiple Graphs**

Change the view in [Devices](#)<sup>1908</sup> menu tab to multiple small graphs. This will display live graphs, and graphs for three other time spans. This will display all graphs in one tab.

- **Show Geo Maps**

Choose if you want to show geographical maps in the Enterprise Console.

- **Show News Feed**

Choose if you want to show the news feed in the Enterprise Console.

- **Next Viewpoint**

Go forward to the next viewpoint (only available if you went back to a previous viewpoint before). This is similar to a browser's function to go forth in history.

- **Previous Viewpoint**

Go backwards to the previous viewpoint. This is similar to a browser's function to go back in history.

- **Open in Web Browser**

This will open the currently selected object in the Ajax web interface. This option is not available if multiple objects are selected. The default browser can be set in the [Options](#)  settings.

## Help

This menu provides web site links to the **HTML manual**, the Paessler **Knowledge Base**, and the **PRTG Network Monitor homepage**. You can start the [Configuration Guru](#)  and display program information when you select **About...**

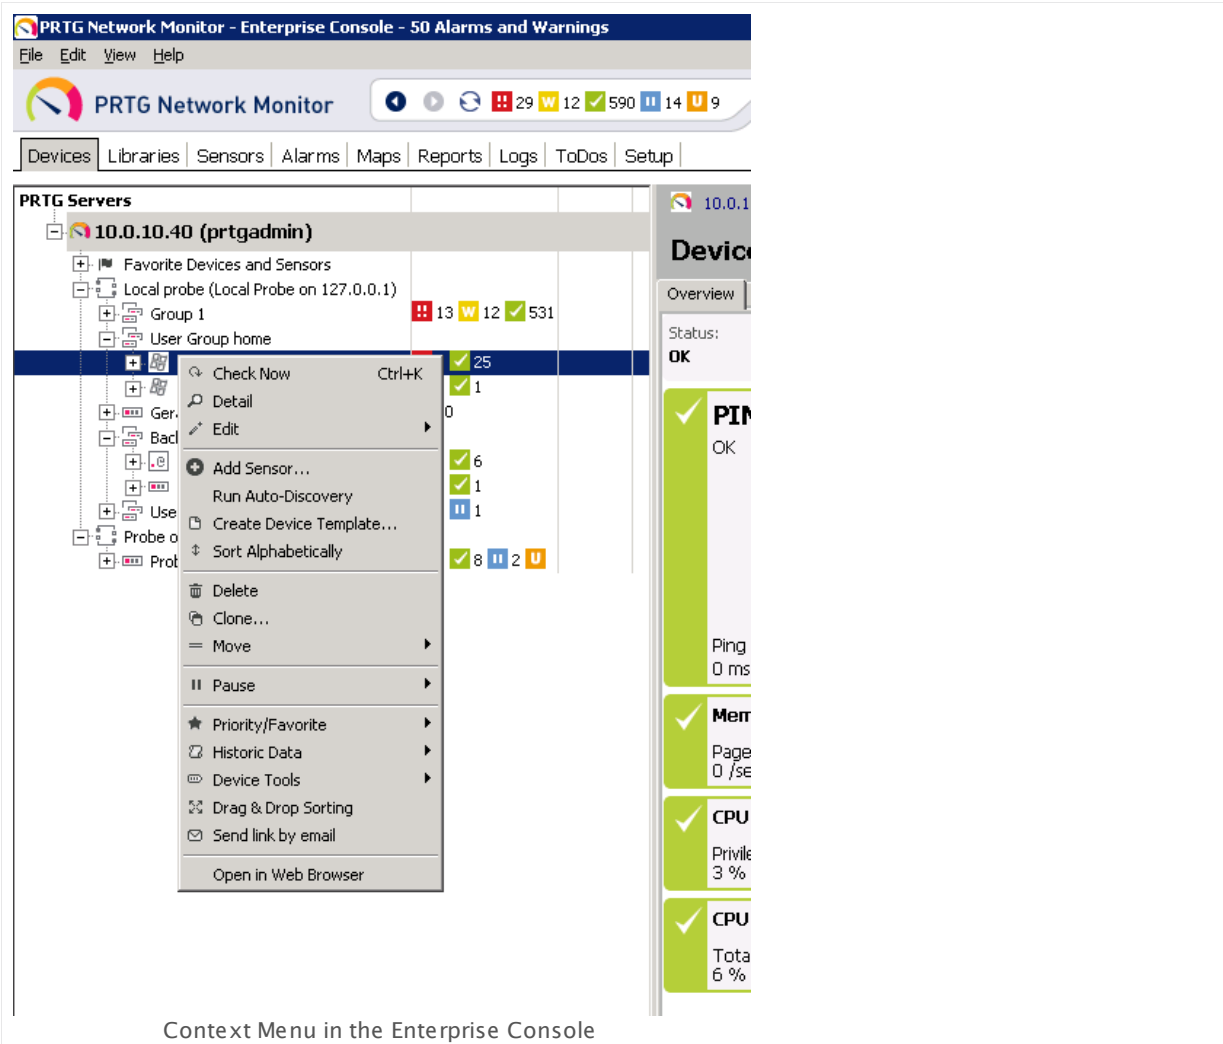

## See Also

- [Shortcuts Overview](#) 

## 8.7 Context Menus

For every object in the Enterprise Console, there are context menus available which appear when you right-click on object. These context menus vary depending on the selected object and always contain a sub-set of the options available in the Windows menu. For detailed explanations, please see [Windows Menu Structure](#) <sup>1936</sup>.

Context Menu in the Enterprise Console

## 8.8 Shortcuts Overview

The following shortcut keys are available in the Enterprise Console:

**Alt+X:** File | Close **or** Exit

With the **Show in Tray** option enabled in the [Options](#)<sup>1930</sup> settings, this will be **Close**; otherwise **Exit**.

**Ctrl+Alt+X:** File | Close and Exit

This menu item is only shown if the **Show in Tray** option is enabled in the [Options](#)<sup>1930</sup> settings.

**Alt+Right:** Next Viewpoint

**Alt+Left:**

**Ctrl+C:** Edit | Check Now

**Ctrl+E:** Edit | Pause | Set Sensor to Error

**Ctrl+P:** Edit | Pause | Indefinitely

**Ctrl+R:** Edit | Pause | Resume

**Ctrl+L:** View | Large Single Graph

**Ctrl+S:** View | Small Multi Graphs

**Ctrl+H:** View | Hide Google Map

**Ctrl+Del:** Edit | Acknowledge all ToDos (available only while in ToDos tab)

**F5:** View | Refresh

**F6:** [Context Menu] | Tools | **Custom tool command, if available**

**F7:** [Context Menu] | Tools | **Custom tool command, if available**

**F8:** [Context Menu] | Tools | **Custom tool command, if available**

**F9:** [Context Menu] | Tools | **Custom tool command** (default: **Remote Desktop**)

**F10:** [Context Menu] | Tools | **Custom tool command, if available**

**F11:** [Context Menu] | Tools | **Custom tool command, if available**

**F12:** [Context Menu] | Tools | **Custom tool command, if available**

## Other User Interfaces

## 9 Other User Interfaces

This chapter introduces other available user interfaces additional to PRTG's Ajax web interface and Enterprise Console. There are special interfaces optimized for mobile access, including apps for mobile devices. Read more in the following sections.

### Other User Interfaces—Topics

- [Mobile Web GUI](#)  1947
- [Smart phone Apps](#)  1950

### Related Topics

- [Ajax Web Interface—Basic Procedures](#)  100
- [Ajax Web Interface—Device and Sensor Setup](#)  188
- [Ajax Web Interface—Advanced Procedures](#)  1726
- [Enterprise Console](#)  1894

## 9.1 Mobile Web GUI

The Mobile Web GUI is a slim interface to view your monitoring results while on the go. It is optimized for both small screens and low bandwidth usage in order to provide an easy and fast access to your PRTG core server when connecting with mobile devices. You can view sensor lists, data tables, and graphs with live data.

Compared to the [Ajax Web GUI](#)<sup>[100]</sup>, this interface comes with limited functionality and is primarily provided for quick review of data while on the go. Nevertheless, you can acknowledge alarms, pause or resume monitoring, and interactively view geo maps as well as sensors and other lists.

This interface is based on jQuery Mobile 1.0, supporting all major mobile operating systems and browsers.

### Loading the Web Interface

Make sure your PRTG core installation is accessible via the internet. In your mobile device, enter the IP address or URL of the system PRTG is installed on. When using a cluster, you can connect to any node accessible.

If you see a certificate warning in your browser, you can usually just confirm it. For more information please see [SSL Certificate Warning](#)<sup>[105]</sup>.

### Login Screen

After loading the web interface, the login screen is shown.

The screenshot shows the login interface for PRTG Network Monitor. On the left, under the heading "PRTG NETWORK MONITOR", there are input fields for "Login Name" and "Password". Below these are three radio button options: "Use AJAX Web GUI (All features, optimized for desktop access)", "Use Mobile Web GUI (Limited functionality, optimized for mobile access)" (which is selected), and "Download Client Software (for Windows, iOS, Android)". At the bottom left are two buttons: "Login" and "Default Login". A link "Forgot password? Need Help?" is below the "Login" button. On the right side, there is the PRTG Network Monitor logo and a section titled "NEWS FROM PAESSLER" containing three short news items. At the bottom center, the text "Mobile Web GUI Login" is displayed.

Enter your credentials, choose the **Use Mobile Web GUI (Limited functionality, optimized for mobile access)** option, and click on **Login**. For detailed information about different credentials, please see the [Login](#)<sup>[102]</sup> section for the Ajax Web GUI.

## General Layout

The home screen of the Mobile Web GUI shows the sensor overview as well as all available main menu entries. Click/tab on menu items to get to groups, devices, and sensor data. You will be guided through a sequence of sub and sub-sub screens. Whenever you get lost, click/tab on the house symbol in the upper left corner to get back to the home screen.

There are also different sensor top lists available underneath the **Sensors** menu entry. **Note:** Most of the functionality is read-only, because this interface is intended for viewing data. In order to change your monitoring configuration or settings, please switch to the [Ajax Web Interface](#)<sup>[100]</sup>. If you would like to have more options on your mobile devices, take a look at our [Smart phone Apps](#)<sup>[1950]</sup>.

## Using the Mobile Web GUI

The device tree and lists of sensors, alarms, logs, and tickets are available as usual, but in a view optimized for mobile screens. In addition, you can show monitoring data for all objects. This section will not explain the GUI in detail, because the concepts are the same as throughout the [Ajax web interface](#)<sup>[100]</sup>. In the following, find a list with the main differences compared to the full Ajax interface:

- There are no context menus available, but actions such as acknowledge an alarm, scan now, pause, etc. can be initiated directly on an objects detail page, using the respective buttons.

- Reports and Maps are accessible in view only mode.
- You cannot edit system settings.
- To save bandwidth, an automatic page refresh is only activated after dedicated confirmation.
- You can switch from the Mobile Web GUI to the Ajax web interface at any time by using the **Switch to AJAX GUI** option.

You will just need a few minutes to get familiar with this interface, because the structure is basically the same as you know it from PRTG's Ajax web interface. Have fun monitoring while on the go!

## 9.2 Smartphone Apps

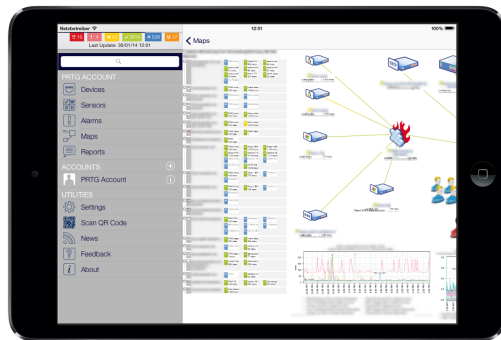

You can access your PRTG installation on your mobile devices with several PRTG apps. We provide apps for iOS devices, Android systems, Windows Phone, and BlackBerry. You can download and use these apps for free. [PRTG for iOS](#)<sup>1950</sup>, [PRTG for Android](#)<sup>1950</sup>, [PRTG for Windows Phone](#)<sup>1951</sup>, and [PRTG for BlackBerry \(beta\)](#)<sup>1951</sup> make it possible to monitor your network while on the go.

The basic requirements to use these free apps are a running PRTG core server which is accessible from the network your device is connected to (either directly or via a VPN connection) and a recent operating system version on your mobile device. For details about requirements, see below.

If there is no suitable PRTG app available for your mobile device, use the [Mobile Web GUI](#)<sup>1947</sup> interface as an alternative.

### PRTG for iOS

PRTG for iOS is the iOS app for PRTG Network Monitor version 12 or later. You can use it on iPhone, iPad, and iPod touch with iOS version 6 or later. Background notifications require iOS 7. For more information and in order to download this app, please see our web page [PRTG for iOS](#).

Maps on iPad

### PRTG for Android

PRTG for Android is the Android app for PRTG Network Monitor version 13.1 or later. Use it on your smartphone or tablet with Android version 4.0 or later, or on a Kindle Fire. For full functionality, we recommend using at least PRTG 13.x.4 and Android 4.1. For more information and in order to download this app, please see our web page [PRTG for Android](#).

Sensor List on PRTG  
for Android

## PRTG for Windows Phone

PRTG for Windows Phone is the Windows Phone app for PRTG Network Monitor 13.3 or later. You can run it on Windows Phone 8.0 or later. For more information and in order to download this app, please see our web page [PRTG for Windows Phone](#).

PRTG for Windows Phone  
Menu

## PRTG for BlackBerry

PRTG for BlackBerry (beta) is the BlackBerry app for PRTG Network Monitor 13.1 or later. This app requires BlackBerry 10.2 or later (supported devices are BlackBerry Q5, Q10, Z10, Z30, and P9982). For more information and in order to download this app, please see our web page [PRTG for BlackBerry](#).

**Note:** This app is in beta status. You cannot deploy PRTG for BlackBerry via **BlackBerry Enterprise Service (BES) 10**.

## Sensor Technologies

# 10 Sensor Technologies

This chapter introduces different technologies that PRTG uses for monitoring in order to give you more background information. Please read more in the following sections.

## Sensor Technologies—Topics

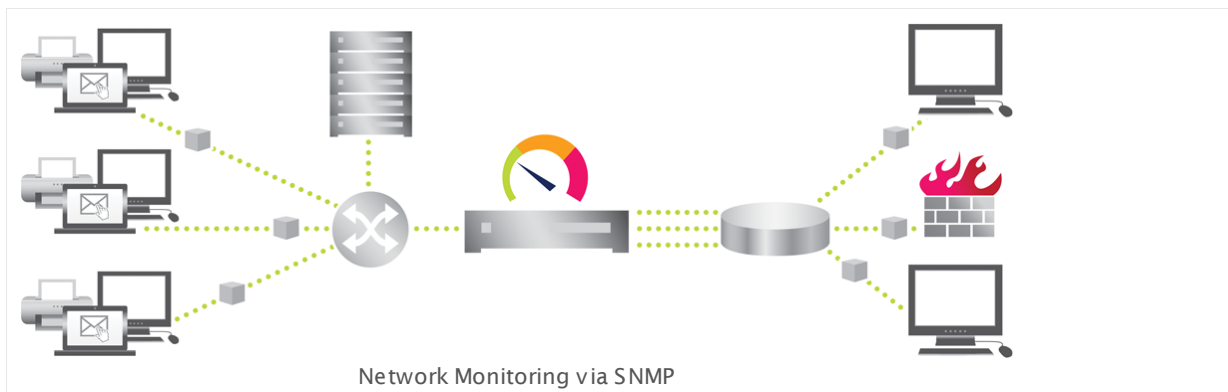

- [Monitoring via SNMP](#)  1955
- [Monitoring via WMI](#)  1959
- [Monitoring via SSH](#)  1962
- [Monitoring Bandwidth via Packet Sniffing](#)  1964
- [Monitoring Bandwidth via Flows](#)  1966
- [Bandwidth Monitoring Comparison](#)  1969
- [Monitoring Quality of Service](#)  1971
- [Monitoring Email Round Trip](#)  1975
- [Monitoring Backups](#)  1977
- [Monitoring Virtual Environments](#)  1978
- [Monitoring Databases](#)  1987
- [Monitoring Syslogs and SNMP Traps](#)  1989

## 10.1 Monitoring via SNMP

Monitoring via Simple Network Management Protocol (SNMP) is the most basic method of gathering bandwidth and network usage data.

### How SNMP Monitoring Works

SNMP can be used to monitor bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory, CPU load, etc. The queried devices must support SNMP.

When this technology is used, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These are triggering reply packets from the device. Compared to PRTG's other bandwidth monitoring technologies via flows, packet sniffing, or WMI, the SNMP option creates the least CPU and network load.

### Reasons to Choose SNMP Monitoring

SNMP is the most commonly used method mainly because it is easy to set up and requires minimal bandwidth and CPU cycles. If your network devices support SNMP and/or if you want to monitor large networks with several hundred or thousands of sensors, we recommend you start with SNMP. Besides network usage monitoring, another well-known feature of SNMP is the ability to also watch other network parameters such as CPU load, disk usage, temperature, as well monitoring many other readings, depending on the queried device.

### SNMP Network Issues

In order to use Simple Network Management Protocol (SNMP) for monitoring purposes, it is imperative that UDP packets are allowed to travel from the machine running PRTG to the device you want to monitor and back, which is usually the case in LANs and Intranets. For connections across the internet, to a Demilitarized Zone (DMZ), or for Wide Area Network (WAN) connections, some changes to the traversed firewalls may be necessary. Keep in mind that SNMP V1 and V2c are not secure protocols and should not be used across the internet or insecure data connections. Only SNMP version 3 supports encryption.

## Understanding SNMP Sensors

To better understand and set up SNMP sensors, you may want to learn more about the principle of Object Identifiers (OID) and Management Information Base (MIB). For more information about this, please refer to the Knowledge Base article in the [More](#) <sup>1956</sup> section below.

For an overview and details about all SNMP sensors, please see the [List of Available Sensor Types](#) <sup>293</sup> section.

## SNMP Versions

PRTG supports three versions of the SNMP protocol: Version 1, version 2c, and version 3.

### SNMP Version 1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices; simple to set up.
- Contra: Limited security as it only uses a simple password (**community string**) and data is sent in clear text (unencrypted). It should therefore only be used inside LANs behind firewalls, not in WANs; only supports 32-bit counters which is not enough for high-load (gigabits/second) bandwidth monitoring.

### SNMP Version 2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Contra: Limited security (same as with SNMP V1).

### SNMP Version 3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption, increasing available security; plus all advantages of Version 2c.
- Contra: Difficult to configure. Not suitable for large networks (see below for more information).

It is important to know that if you select an SNMP version which is not supported by the server or device you want to monitor, you will receive an error message. Unfortunately, in most cases, these error messages do not explicitly mention the possibility that you could be using the incorrect SNMP version. These messages provide minimum information only, such as **cannot connect** or similar. Similar error occur when community strings, usernames, or passwords don't match.

## SNMP Overload and Limitations of the SNMP System

SNMP V1 and V2 scale directly with the performance of the hardware and the speed of the network. In our labs we were able to monitor 30,000 SNMP V1 sensors at a 60 second interval with one PRTG server (core and local probe) plus two remote probes with 10,000 sensors each.

However, SNMP V3 has performance limitations due to the SSL encryption. The main limiting factor is CPU power (as well as the other general limits for PRTG). Because of this limitation, you can monitor only a limited number of sensors per second using SNMP V3. Currently, PRTG is able to handle roughly 40 requests per second and computer core, depending on your system. This means that, on a common 1.x GHz computer with two cores, you can run about 5,000 SNMP v3 sensors with a 60 seconds scanning interval; on a system with four cores, you can monitor around 10,000 sensors with 60 seconds interval. The CPU load is at about 50% then. We do not recommend more.

Furthermore, the PRTG core server and probes should run on different computers. If you experience increased values in the **Interval Delay SNMP** or **Open Requests** channels of the **Probe Health** 816 sensor (values above 0 % indicate that the SNMP requests cannot be performed at the desired interval), you need to distribute the load over multiple probes. SNMP V1 and V2 do not have this limitation.

If you run into SNMP overload problems you have three options:

- Increase the monitoring interval of the SNMP V3 sensors.
- Distribute the SNMP V3 sensors over two or more probes.
- Switch to SNMP V1 or V2 if you can go without encryption.

## What is the SNMP Community String?

The SNMP **Community String** is similar to a user ID or password that allows access to a router's or other device's statistics. PRTG Network Monitor sends the community string along with all SNMP requests. If the correct community string is provided, the device responds with the requested information. If the community string is incorrect, the device simply discards the request and does not respond.

**Note:** SNMP community strings are only used by devices that support SNMP V1 and SNMP V2c protocols. SNMP V3 uses safer username/password authentication, along with an encryption key.

By convention, most SNMP V1/V2c equipment ships with a read-only community string set to the value **public**. It is standard practice for network managers to change all the community strings to customized values during device setup.

## 10.2 Monitoring via WMI

Windows Management Instrumentation (WMI) is Microsoft's base technology for monitoring and managing Windows based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on the system performance. In addition to strict WMI sensors, there are sensors which use another approach to monitor Windows systems with less influence on the system performance.

### Monitoring Windows Systems: Performance Counters

Besides sensors which monitor Windows systems only via WMI, PRTG provides sensor types which use a **hybrid** approach. These sensors first try to query data via Windows **Performance Counters** using **Remote Registry Service**. Querying Performance Counters needs less system resources than monitoring via WMI. These Windows sensors use WMI as a fallback if Performance Counters are not available or cannot be read out. When running in fallback mode, PRTG re-tries to connect to Performance Counters after 24 hours. This is the default approach and can be changed in the **Windows Compatibility Options** in the [Device Settings](#)<sup>[272]</sup>. Though, it can be the case sometimes that these Performance Counters differ from the direct method.

**Note:** You can identify these hybrid sensors by looking at their categories, for example, in the add sensor dialog. **Search directly** for "windows" and select "Performance Counters" as **Technology Used**. Among them are various sensors with "Windows" in the name, as well as some Hyper-V sensors.

### How WMI Works

WMI allows accessing data of many Windows configuration parameters, as well as current system status values. Access can be local or remote via a network connection. WMI is based on **COM** and **DCOM** and is integrated in Windows 2000, XP, 2003, Vista, 2008, Windows 7, and Windows 8 (add-ons are available for Windows 9x and NT4). PRTG officially supports WMI for Windows XP or later.

In order to monitor remote machines, PRTG's WMI sensor needs Active Directory account credentials to have access to the WMI interface. You can enter these credentials in PRTG for the parent device or group, or in the [Root](#)<sup>[224]</sup> group. The sensor will then inherit these settings.

**Note:** Sensors using the Windows Management Instrumentation (WMI) protocol generally have high impact on the system performance! Try to stay below 200 WMI sensors per [probe](#)<sup>[77]</sup>. Above this number, please consider using multiple [Remote Probes](#)<sup>[200]</sup> for load balancing.

For an overview and details about all WMI sensors, please see the [List of Available Sensor Types](#)<sup>[294]</sup> section.

## Limitations of WMI on Windows Vista and Windows Server 2008 R1

You should be aware that performance of WMI based monitoring is drastically limited when the monitoring station or the monitored client runs on Windows Vista or Windows Server 2008 R1. When it comes to network monitoring via WMI, Windows XP and Windows 2003 are up to 70 times faster than Windows 2008 or Vista.

**Note:** These are not limitations of PRTG, but arise from the WMI functionality built into the Windows operating systems mentioned.

The results of our tests are:

- On Windows XP/Windows 2003/Windows 7/Windows 2008 R2 you can run about 10,000 WMI sensors with one minute interval under optimal conditions (such as running the core and the target systems exclusively under Windows 2003 and being located within the same LAN segment). Actual performance can be significantly less depending on network topology and WMI health of the target systems - we have seen configurations that could not go beyond 500 sensors (and even less).
- On Windows Vista/Windows 2008 R1 you can run about 300 WMI sensors with one minute interval.
- The more Windows Vista/Windows 2008/Windows 7 client systems you have in your network the more WMI monitoring performance will be affected.
- System performance (CPU, memory etc.) of virtualization does not strongly affect WMI monitoring performance.

If you want to use WMI for network monitoring of more than 20 or 30 systems, please consider the following rules:

- Do not use Windows Vista or Windows 2008 R1 as monitoring stations for WMI-based network monitoring.
- If possible use Windows 2003 R2 Server for WMI based network monitoring (followed by XP and Windows 7/2008 R2).
- If you cannot run PRTG on Windows XP/Windows 2003 consider setting up a remote probe with XP for the WMI monitoring. (You still get far better WMI monitoring performance with a remote probe on a virtual machine running Windows XP or Windows 2003 than on any bare metal system running Windows Vista/Windows 2008 R1.)
- Consider switching to SNMP-based monitoring for large networks. Using SNMP you can easily monitor 10 times as many nodes as with WMI (on the same hardware).

- <http://www.paessler.com/blog/2010/09/22/>

## 10.3 Monitoring via SSH

Monitoring via Secure Shell (SSH) enables you to gather performance and system data from many Linux and Unix distributions, as well as from certain Mac OS X systems. If your system is supported this monitoring works natively without the need of additional software on the target systems.

### How Monitoring via SSH Works

In order to monitor remote machines via SSH, PRTG needs credentials (preferably root access) of the devices. If you use PRTG's SSH sensors, you can enter the necessary credentials in PRTG for the parent device or group, or in the [Root](#) group, in the [Credentials for Linux \(SSH/WBEM\) Systems](#) section within the [Settings](#) tab. The sensors will then inherit these settings.

With each scanning interval, PRTG will login to your devices and query data by executing specific commands.

For an overview and details about all SSH sensors, please see the [List of Available Sensor Types](#) section.

### Limitations When Using SSH Monitoring

Due to the plurality of Linux/Unix derivatives, PRTG's SSH sensors cannot support all distributions on the market. Also, only certain Mac OS systems are supported. For a detailed list please see the [More](#) section below.

### Authentication via SSH Private Key

PRTG supports authentication via password or via private key.

When using a private key, please ensure the following:

- Provide the key in [OpenSSH](#) RSA format.
- The key may **not** be encrypted! PRTG does **not** support password protected keys.
- The key must be provided as [RSA](#) key, you cannot use DSA keys with PRTG!

When providing an unencrypted RSA private key in OpenSSH RSA format, please copy the entire key, including the

```
-----BEGIN RSA PRIVATE KEY-----
```

and

```
-----END RSA PRIVATE KEY-----
```

lines, into the according text field in PRTG and **Save** your settings. Once pasted and saved, the private key will be shown as

```
*****
```

Please make sure there exists a corresponding public key on the target device.

For a detailed description how to convert and use an existing SSH key, please see the [More](#)  section below.

## 10.4 Monitoring Bandwidth via Packet Sniffing

Packet Sniffing should come into consideration if your network device(s) do not support SNMP or xFlow to measure bandwidth usage and if you need to differentiate the bandwidth usage by network protocol and/or IP addresses.

**Note:** Packet Sniffer Sensors support Toplists (Top Talkers, Top Connections, etc.), see [Toplists](#) <sup>1728</sup> section.

### How Packet Sniffing works

If you need to know what applications or IP addresses are causing the traffic in your network, you can use a packet sniffer. This will look at every single data packet traveling through your network for accounting purposes.

PRTG can analyze the packets passing the network card of a PC or it can be connected to the so-called monitoring port of a switch. In order to calculate bandwidth usage, PRTG inspects all network data packets either passing the PC's network card (shown on the left side) or the data packets sent by a monitoring port of a switch (right side) with its built-in packet sniffer. Using remote probes you can set up packet sniffers anywhere in your network (see [Add Remote Probe](#) <sup>2049</sup> section).

Comparing the four bandwidth monitoring technologies provided by PRTG (SNMP, WMI, xFlow and packet sniffer) this one creates the most CPU and network load and should thus only be used in small to medium networks, on dedicated computers for larger networks or for individual computers.

### Reasons To Choose Packet Sniffing

It is important to understand that the packet sniffer can only access and inspect data packets that actually flow through the network interface(s) of the machine running the PRTG probe software. This is fine if you only want to monitor the traffic of this machine (e.g. your web server). In switched networks, only the traffic for a specific machine is sent to each machine's network card, so PRTG can usually not discern the traffic of the other machines in the network.

If you also want to monitor the traffic of other devices in your network, you must use a switch that offers a "monitoring port" or "port mirroring" configuration (Cisco calls it "SPAN"). In this case the switch sends a copy to the monitoring port of all data packets traveling through the switch. As soon as you connect one of the PRTG probe system's network cards to the switch's monitoring port, PRTG is able to analyze the complete traffic that passes through the switch.

Another option is to set up the PC running PRTG as the gateway for all other computers in the network.

## Set Up Packet Sniffer Sensors

Find details on how to set up the different flow sensors in the following sections:

- [Packet Sniffer Sensor](#) 
- [Packet Sniffer \(Custom\) Sensor](#) 

## Header Based Packet Sniffing

For packet sniffing, PRTG looks at the IPs and ports of source and destination to assess the protocol. This is a very fast method which saves system resources. **Note:** At times, this method is not fully accurate. For example it is not possible to identify HTTP traffic on ports other than 80, 8080 and 443 as HTTP. HTTP traffic on non-standard ports would not be accounted as such.

- <http://kb.paessler.com/en/topic/60203>

## 10.5 Monitoring Bandwidth via Flows

Using Flow protocols you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view [Toplists](#)<sup>1728</sup> for all xFlow (including IPFIX) sensors.

### How xFlow Monitoring works

You can measure bandwidth usage **by IP address** or **by application** in a network, using one of the xFlow (including IPFIX) protocols. They are the best choice especially for networks with high traffic (connections with 100s of megabit or gigabits). For xFlow monitoring the router gathers bandwidth usage data (**flows**), aggregates them and sends information about these flows to PRTG using UDP packets. When sampling is used (mandatory for sFlow) only information about every n-th packet is sent to PRTG which reduces CPU load a lot. Because the switch already performs a pre-aggregation of traffic data, the flow of data to PRTG is much smaller than the monitored traffic. This makes xFlow the ideal option for high traffic networks that need to differentiate the bandwidth usage by network protocol and/or IP addresses.

### NetFlow and IPFIX Monitoring

The NetFlow (and IPFIX) protocol is mainly used by Cisco devices. Once configured, the router sends for each data flow a NetFlow or IPFIX packet to the monitoring system running on a PRTG probe. There the data can be filtered and evaluated. There are different NetFlow and IPFIX sensors available: The basic ones offer predefined channel definitions, the custom variants enable you to define your own channels.

The advantage of using NetFlow or IPFIX:

- Generates little CPU load on the router itself (according to Cisco 10,000 active flows create about 7% additional CPU load; 45,000 active flows account for about 20% additional CPU load).
- Generates less CPU load on the PRTG core system, compared to packet sniffer sensors.

**Note:** You must enable NetFlow or IPFIX export on the device you want to monitor. The device must send a flow data stream to the IP address of the PRTG probe system on which the NetFlow or IPFIX sensor is set up. Juniper **jFlow** monitoring is reported to work as well, using NetFlow v5 sensors.

### sFlow Monitoring

sFlow works similar to NetFlow monitoring. The router sends data flow packets to the monitoring system running on a PRTG probe. The most obvious difference between the two flow protocols: With sFlow, not all of the traffic is analysed, but only every n-th packet. It is like having a river of traffic and you take a cup of water out of it ever so often and analyze it.

The advantage is clear: There is less data to analyze, there is less CPU load needed and less monitoring traffic is generated. Yet you can get a good insight into your network's bandwidth usage. **Note:** Currently, PRTG supports sFlow version 5.

## Set Up Flow Sensors

Find details on how to set up the different flow sensors in the following sections:

- [NetFlow V5 Sensor](#)  700
- [NetFlow V5 \(Custom\) Sensor](#)  708
- [NetFlow V9 Sensor](#)  716
- [NetFlow V9 \(Custom\) Sensor](#)  724
- [IPFIX Sensor](#)  641
- [IPFIX \(Custom\) Sensor](#)  649
- [sFlow Sensor](#)  871
- [sFlow \(Custom\) Sensor](#)  879
- [jFlow V5 Sensor](#)  664
- [jFlow V5 \(Custom\) Sensor](#)  672

## Limitations

On a powerful 2008 PC (Dual Core, 2.5 Ghz), you can process about 100,000 flows per second for one xFlow stream. Using sampling the number of actual flows can be much higher. When using complex filters, the value can be much lower. For example, with a router sending about 2,000 flows/second (which corresponds to mixed traffic at gigabit/sec level without sampling) you can expect to configure up to 50 NetFlow sensors operating properly. PRTG internally monitors its own NetFlow processing, and you will see a decreased values in the **Core/Probe Health** sensor's **Health** channel as soon as NetFlow packets are not processed due to an overload (you find this sensor on the Local Probe device).

If you experience an overload please consider using sampling or setting up multiple probes and distribute the NetFlow streams to them. We do not recommend adding more than 400 NetFlow sensors per PRTG probe.

This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

## 10.6 Bandwidth Monitoring Comparison

The following table shows the differences between PRTG's four methods available for bandwidth monitoring:

	WMI	SNMP	Packet Sniffer	xFlow (IPFIX, Netflow, sFlow, jFlow)
Setup	Medium	Easy	Easy to Complex (depending on filter rules used)	Can be complex (e.g. the switch must be configured)
Traffic can be filtered	No	No	Yes	Yes
Differentiate bandwidth usage by protocol or IPs	No	No	Yes	Yes
PRTG can show Toplists (Top Talker, Top Connections, Top Protocols etc.)	No	No	Yes	Yes
Filter bandwidth usage by IP	No	No	Yes	Yes
Filter bandwidth usage by MAC address	No	No	Yes	No
Filter bandwidth usage by physical network port	Yes	Yes	No	No

## Part 10: Sensor Technologies | 6 Bandwidth Monitoring Comparison

	WMI	SNMP	Packet Sniffer	xFlow (IPFIX, Netflow, sFlow, jFlow)
Monitor network parameters other than bandwidth usage	Yes	Yes	No	No
CPU load on the machine running PRTG	Low	Low	Higher, depends on the amount of traffic	Higher, depends on the amount of traffic
Excess bandwidth usage of monitoring	Small	Small	None (except when monitoring switch ports are used)	Depends on the traffic

## 10.7 Monitoring Quality of Service and VoIP

PRTG can monitor the Quality of Service in a network with dedicated QoS sensors, as well as Cisco IP Service Level Agreement (SLA) and Cisco Class Based Quality of Service (CBQoS). Slight variations of network parameters like jitter, packet loss, or packet delay variation (PDV) usually have only little effect on TCP based services (e.g. HTTP, SMTP, etc.). But for UDP based services like Voice over IP (VoIP) and video streaming a steady stream of data packets is crucial. The sound quality of a VoIP call drops dramatically when UDP packets are not received in a timely fashion, or if packets are lost or out-of-order. As a rule of thumb for good quality of service (in a VoIP perspective) you would want low measurements for jitter (less than 20 to 50 ms) and PDV (less than 100 ms) and preferably **zero** measurements for packet loss, duplicated packets, or packets in wrong order.

For Quality of Service measurements, four sensors are available:

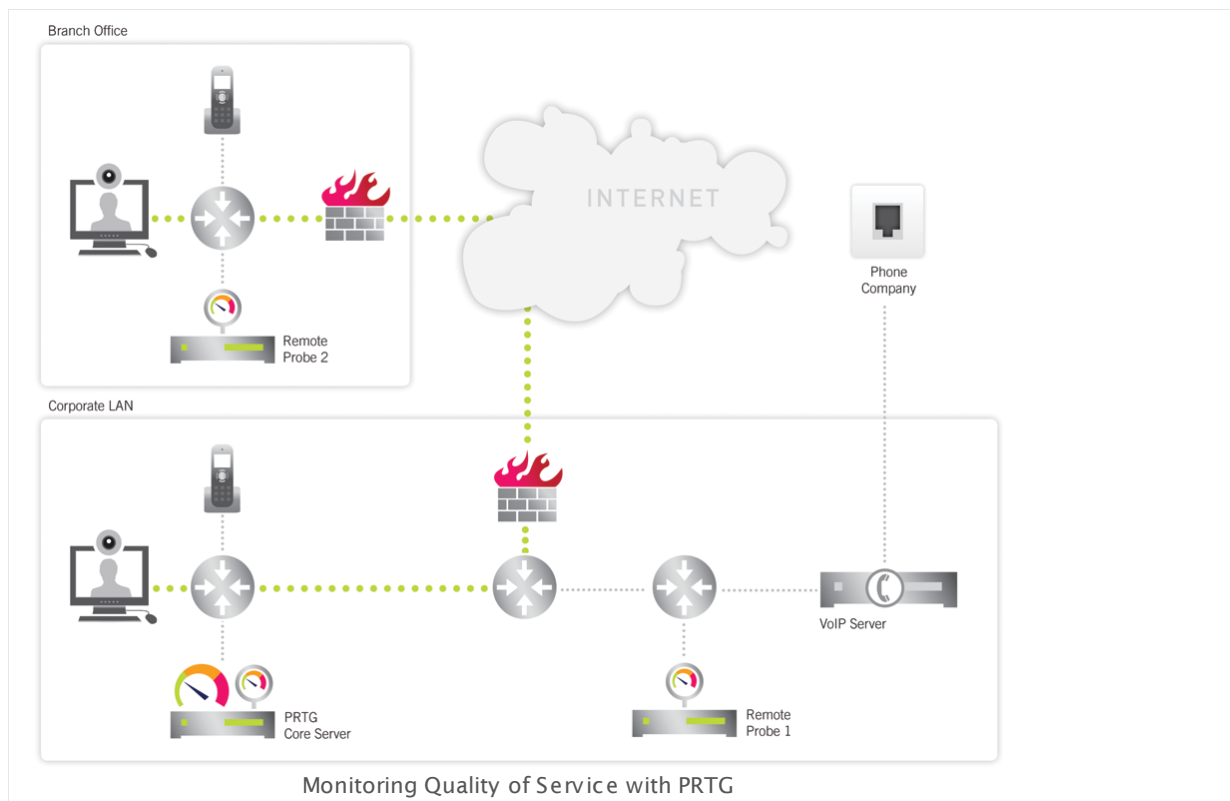

- [QoS \(Quality of Service\) Sensor](#)<sup>[820]</sup>  
Monitors VoIP relevant network parameters by testing network connection quality between two probes.
- [QoS \(Quality of Service\) Round Trip Sensor](#)<sup>[826]</sup>  
Monitors VoIP relevant network parameters by testing network connection quality between two probes. Traffic is measured bidirectional.
- [Cisco IP SLA Sensor](#)<sup>[337]</sup>  
Monitors VoIP relevant network parameters through IP SLA results from Cisco devices (via SNMP).
- [SNMP Cisco CBQoS Sensor](#)<sup>[953]</sup>  
Monitors VoIP relevant network parameters by using Cisco's CBQoS (via SNMP).

### QoS (Quality of Service) Sensor

The QoS Sensor is used to monitor the quality of a network connection by measuring the following parameters:

- Jitter in ms according to RFC 3550
- Packet delay variation (PDV) in ms according to RFC 3393
- Lost packets in %
- Out-of-order packets in %
- Duplicated packets in %

The measurements are taken by sending UDP packets between two probes. This means that you can test any network connection in your network by simply placing a [remote probe](#)<sup>[2049]</sup> on (or near) each 'end' of the connection and measuring the connection quality between them. This is the perfect tool to find network issues that can affect VoIP sound quality or video streaming 'hiccups'.

As mentioned before, measurements are taken between two probes. So the first step is to place two PCs running a remote probe on (or near) both ends of the connection that you want to monitor. As an alternative, the local probe on the PC running the PRTG core can also be used as one end. If any firewalls, packet filters or Network Address Translation (NAT) systems are en route, you must configure them as necessary so that the UDP packets can reach the target probe.

In PRTG, create a new QoS sensor on a **Probe Device**. Please find details about settings in the [QoS \(Quality of Service\) Sensor](#)<sup>820</sup> section. With the settings for number and for size of the packets you can configure the test data stream. 1,000 packets of 172 bytes each is a good start, but if your applications use larger packets you may want to enter other values here. Try to configure the test streams with parameters similar to that of the UDP services you are using across this connection.

## Cisco IP SLA Sensor

Wikipedia describes IP SLA as a feature included in the Cisco IOS Software that can allow administrators the ability to Analyze IP Service Levels for IP applications and services. IP SLA uses active traffic-monitoring technology to monitor continuous traffic on the network. This is a reliable method in measuring over head network performance. IP-SLA is mostly used to monitor the sound quality of VoIP traffic.

If you haven't done so already, please add a device in PRTG for the Cisco device that you want to monitor. Then create a new **Cisco IP SLA** sensor on this device. Please find details about settings in the [Cisco IP SLA Sensor](#)<sup>337</sup> section.

This feature is only available in the more expensive Cisco devices. If you don't have IP SLA capable routers/switches you can still get similar information with PRTG's QoS sensor (see [above](#)<sup>[1971]</sup>) which does not require any special hardware—just two PCs running Windows. If you do own hardware which supports IP SLA then PRTG brings you probably the least-cost monitoring solution for IP SLA. Most vendors charge extra for IP SLA support (a thousand bucks and more). Following Paessler's long term policy we simply include this as one of our sensor types. With PRTG you can even use the Freeware Edition to monitor IP SLA!

PRTG monitors the following parameters: Calculated Planning Impairment Factor (ICPIF), Mean Opinion Score (MOS), Average Jitter, Packets Lost, Packets Out Of Sequence, Packets Late, Average Round Trip Time (RTT), DNS RTT, TCP RTT, Transaction RTT. Especially two of these parameters are interesting for VoIP: Mean Opinion Score (MOS) and Calculated Planning Impairment Factor (ICPIF).

## SNMP Cisco CBQoS Sensor

Cisco Class Based Quality of Service (CBQoS) provides information about QoS of Cisco network devices which support the **Modular QoS command line interface (MQC)**. With Class Based QoS, you can obtain monitoring data that includes summary counts and rates by traffic class before and after the enforcement of QoS policies, according to Cisco's CBQoS Management Information Base (MIB) definition. PRTG determines CBQoS data via Simple Network Management Protocol (SNMP). The corresponding sensor type is available out-of-the-box in PRTG version 13.x.5 or later. CBQoS is available in Cisco IOS by default as of version 12.4(4)T.

In order to monitor CBQoS, add a device to PRTG for the Cisco device that you want to monitor. Then create a new **SNMP Cisco CBQoS sensor** on this device. Please see section [SNMP Cisco CBQoS Sensor](#)<sup>[953]</sup> for more details.

This sensor type supports the following CBQoS classes:

- **Class Map:** statistical data about class maps, such as pre- and post-policy packets and sizes, drop packets and size, as well as no-buffer drop packets
- **Match Statement:** statistical data about match statement specific information, such as pre-policy packets and size
- **Queueing:** statistical data about queuing actions, such as current and maximum queue depth, drop packets, and drop size

You can select the desired CBQoS entries which you want to monitor while creating the sensor in PRTG. The available entries are given with their particular connections, their descriptions, and class types.

## Voice over IP

For Mean Opinion Score (MOS) measurements, Cisco conducted a panel test where a wide range of listeners judged the quality of voice samples sent using particular codecs, on a scale of 1 (poor quality) to 5 (excellent quality). The Cisco device calculated the corresponding value for the current network connection based on the network parameter measurements like jitter and packet loss. The values and their meanings are:

MOS	Quality	Expected Quality Impairment
5	Excellent	Imperceptible
4	Good	Perceptible, but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

The second interesting parameter ICPIF is the sum of measured impairment factors minus a user-defined access Advantage Factor that is intended to represent the user's expectations, based on how the call was placed (for example, a mobile call versus a land-line call) (quoted from Cisco's website).

Upper Limit for ICPIF	VoIP Call Communication Quality
5	Very good
10	Good
20	Adequate
30	Limiting case
45	Exceptional limiting case
55	Customers likely to react strongly (complaints, change of network operator)

## 10.8 Monitoring Email Round Trip

Email Round Trip sensors ensure the end-to-end delivery of emails and make it possible to monitor availability and performance of a complete email delivery process. There are two sensor types for this task:

- [SMTP&POP3 Round Trip Sensor](#)  919
- [SMTP&IMAP Round Trip Sensor](#)  911

Both initially deliver an email to a mail server using SMTP. Afterwards the receiving mailbox is scanned using Post Office Protocol version 3 (POP3) or Internet Message Access Protocol (IMAP) until the email arrives. The test email contains a unique code in the topic which is used to identify the email, such as **PRTG Roundtrip Mail: {6D136420-5A3E-46CF-871A-1DAF0C4F3D5D}**.

When PRTG successfully received an email in this email round trip cycle, it marks the respective message for deletion on the mail server. Usually, a mail server will then delete this email. For best performance, we recommend using a dedicated email accounts for email round trip sensors.

In the scenario shown above, there are three steps in the round trip:

- **Step 1**  
PRTG delivers an email via the SMTP protocol to a mail server (just like an email client).
- **Step 2**  
The SMTP server delivers the email to a POP3/IMAP server (which can be located at a remote site, in your local LAN or on the same server as well).

- **Step 3**

Every few seconds PRTG connects to the POP3/IMAP server until the test email arrives.

## Recommended Configuration

Here is a simple concept to check delivery of email out of and into your organization:

1. Create a dedicated email account for this test in your mail system.
2. Set up an external email account (hosted mail server, free mail service, etc.) and configure it to send all emails back to this dedicated email account in your organization (which you created in [Step 1](#)).
3. Set up PRTG's round trip sensor to send an email to the external email account (which you created in [Step 2](#)) using your LAN's mail server and then check for the email account on your mail system (which you created in [Step 1](#)) for arrival of the email.

With this technique you are testing multiple aspects of your email server setup. As long as the sensor shows a green light, this means:

- Your email server accepts emails via SMTP.
- Emails are being sent to the outside world (internet connection works, MX lookups work etc.).
- Emails from external mail server can be delivered into your mail system (this includes aspects like the fact that the MX records for your domain are correct, your mail server can be reached from the outside world, your email filtering is working etc.).
- Emails can be retrieved using POP3 (or IMAP).

**Note:** Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.

## Conclusion

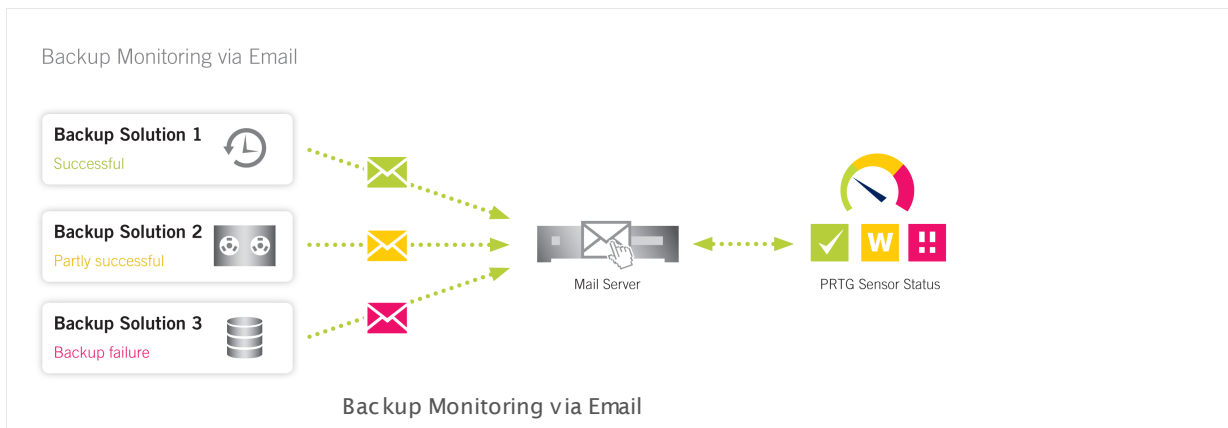

These two sensor types are a great tool to ensure delivery of email from and to your mail servers. Compared to the standard SMTP, POP3 and IMAP sensors - which only check the availability of these services - the two roundtrip sensor types actually monitor the complete transaction from accepting the mail on the first email server to delivery of the mail on the final POP3/IMAP server.

## 10.9 Monitoring Backups

Monitoring your backup software enables you to be sure that your recent backups succeeded. With PRTG you can check the email notifications of various backup jobs. You only need two things for backup monitoring:

1. Configure your backup software to send emails to a dedicated email account, and
2. configure PRTG's [IMAP Sensor](#)<sup>[618]</sup> for backup monitoring.

PRTG will analyze the backup emails for you and set the status of the IMAP sensor accordingly. This way you will see the states of all your backup jobs at a glance.

### Setting up Backup Monitoring

Please refer to our Knowledge Base for a step-by-step tutorial to monitor your backup jobs:

#### Monitoring Backup Solutions via Email

- <http://kb.paessler.com/en/topic/47023>

## 10.10 Monitoring Virtual Environments

A highly flexible IT infrastructure is a common need nowadays and virtualization has become an important pillar of the IT all over the world. Applications in your network might be distributed over many different servers, networks and locations. They might also be in the cloud, and your computations can take place in data centers spread over the whole world. So, if your network connection or any other corresponding hardware fails, hundreds of applications might be unavailable—an impact to your daily business processes which should be avoided at any costs.

Because of this, monitoring the physical infrastructure of your data center is still a must in times of virtual environments. With the layer of virtualization in addition to your physical equipment, your logical infrastructure needs also a close treatment. PRTG assists you to deal with these advanced requirements and enables you to react proactively to issues before they affect your whole system. With PRTG you can monitor all layers of your IT infrastructure in a comprehensible way so you will reduce issues related to dynamic IT environments significantly.

### Monitoring All Layers of Your IT Infrastructure

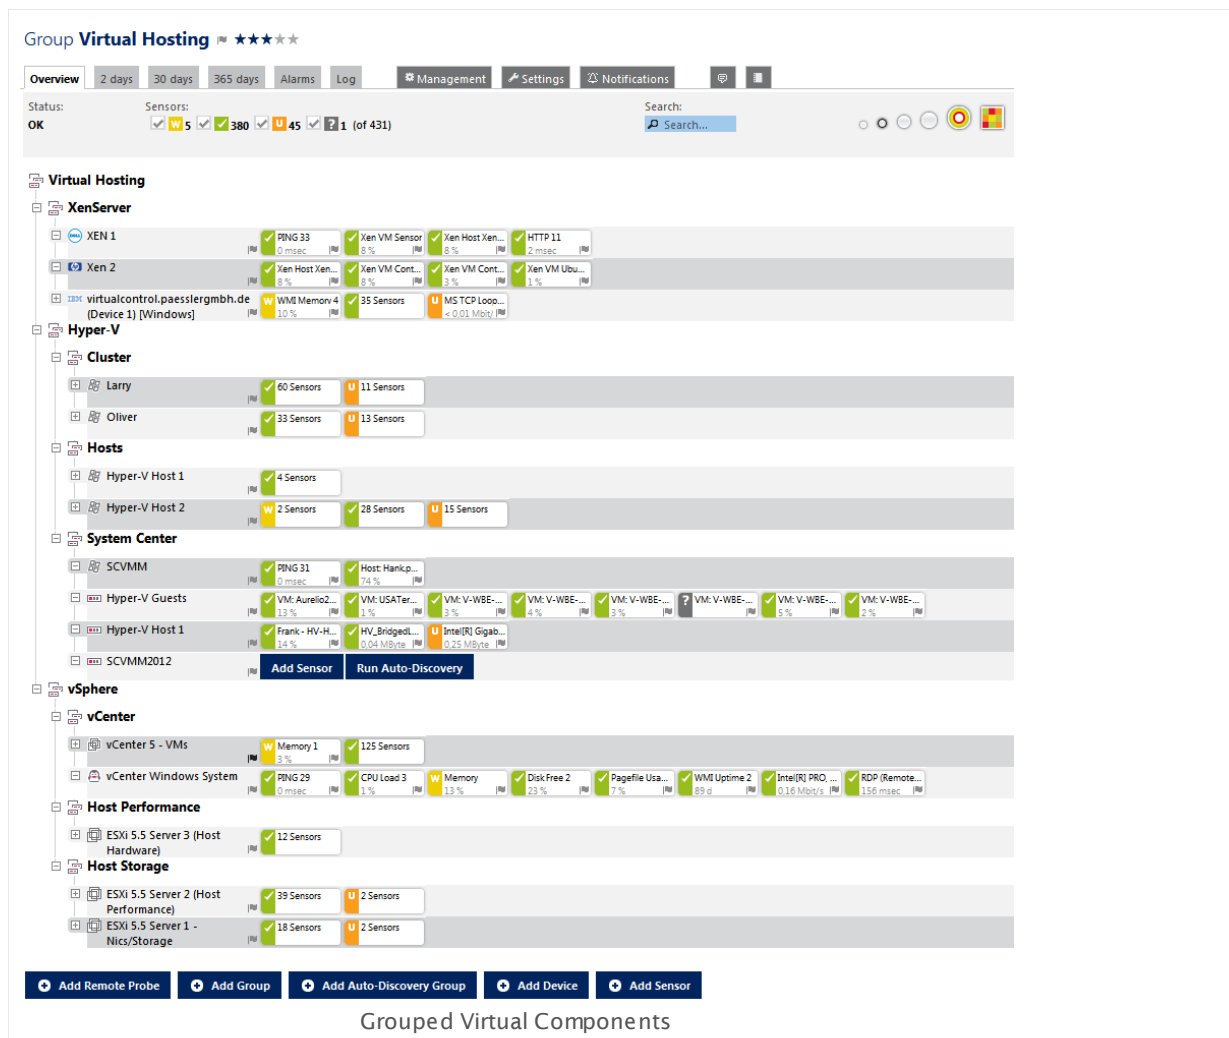

In general, you can assume that with the layer of virtualization you have to monitor a total of four layers in your IT infrastructure:

- **Hardware (Server Racks):** Usually you will set up your monitoring in the common way and monitor most of the hardware components in your network with [PRTG's SNMP sensors](#)<sup>[293]</sup>. You are able to gain monitoring data about many different device readings such as CPU load, memory, disk space, etc. with [this monitoring technology](#)<sup>[196]</sup>, as well as information about network traffic and bandwidth usage of your routers and switches. It is absolutely mandatory for a working IT environment to monitor all hardware components in order to be alerted if something fails or hardware resources are running out. In addition, you can identify potential bottlenecks affecting your virtualized infrastructure. You can set this monitoring up in usual way.
- **Host Server Hardware:** It is essential to monitor the host hardware of your virtualization solution explicitly. If you have issues with your virtual machines (VMs), the origin might be a host hardware failure. You should closely monitor your VM host servers to get alerted if the status is other than "normal". Besides the out of the box hardware sensors, PRTG provides specific sensors for various virtualization host servers; the following monitoring data of your host servers will help you prevent issues in virtualized environments:
  - VMware: current reading and health status (via WBEM), a general status as shown in vSphere (via SOAP), and disk space on ESX(i) (via SSH)
  - Hyper-V: host health critical values, deposited pages, network traffic, CPU usage of guests, hypervisor, and in total
  - Citrix XenServer: CPU, memory, and network usage, the number of running virtual machines on the host server, and load average
  - SCVMM: CPU usage, free memory (in bytes and percent), overall status, communication status, cluster node status, virtual server status, computer status, and the number of VMs

- **VMs from the "Out side":** The virtual machines run on their particular host servers. PRTG can show you the status of single virtual machines and several of their performance counters. It might be helpful to know which resources a single VM uses and needs, but monitoring single VMs is not advisable in every case because it has noticeable influence on the overall performance. Often it will be sufficient to monitor only VMs which are critical for your network. If a VM reaches its capacity limits, PRTG can alert you and you can conduct according resolution steps like enhancing this VM's resources. Indicators for a healthy virtual machine which you can monitor with PRTG out of the box are:
  - VMware: CPU and memory usage, disk read and write speed, read and write latency, and network usage
  - Hyper-V: CPU usage, disk read and write speed
  - Citrix XenServer: CPU usage and free memory
  - SCVMM: CPU usage, disk read and write speed, and the status of the VM
  - Virtuozzo: disk space and network usage
- **VMs from the "Inside" (Operating Systems):** You can monitor the Windows operating system of a single VM with PRTG's standard [WMI sensors](#)<sup>[294]</sup>, for example. [With this technology](#)<sup>[1959]</sup> you can access data of various Windows parameters. Other operating systems like Linux/macOS can make data available via [SSH](#)<sup>[1962]</sup> and [SNMP](#)<sup>[1965]</sup>. The status of the operating systems on your VMs can indicate potential issues of the same, just like the operating systems on your physical machines which are important for a reliably working IT infrastructure: You can monitor these with the same attention, depending on your application scenario, but be careful due to performance considerations. Especially many WMI sensors can result in load problems, so monitor only really important systems "from the inside". Furthermore, you do not need to monitor every item multiple times. For example, it might be sufficient to monitor free disk space only from the outside of the actual VM.

## Monitoring the Virtual Infrastructure

In order to monitor your IT infrastructure, best practice is to set up the monitoring of the hardware layer of your data center first in PRTG, especially in order to find potential bottlenecks which might have an impact on your virtual servers. Then you can start monitoring your virtual environment itself. If you use several solutions for virtual hosting, it is also a good idea to group related host servers, their virtual machines, and the operating systems together. The screenshot below will give you an idea about how to organize this.

The screenshot above shows you the particular group "Virtual Hosting" of an entire PRTG setup. This is an example how monitoring of virtual environments can look like. The sample group contains several subgroups for the virtualization solutions Citrix "XenServer", Microsoft "Hyper-V", and VMware "vSphere". The vSphere group, for example, has three subgroups: we monitor the vCenter VMs and the vCenter Windows system, the performance of the host server, and the storage system of the host.

## Devices for Physical Hosts

In PRTG, set up devices which represent the physical hosts of your virtual machines. For example, for your VMware hosts, add devices which represent the ESX/ESXi servers, for Hyper-V add devices which represent your Hyper-V host servers, for Citrix add devices which represent your Xen servers. If you manage these hosts with a Microsoft System Center Virtual Machine Manager (SCVMM), you can also (or alternatively) add a device for the SCVMM.

Then you can add suitable and expressive sensors to the host server devices. Running PRTG's [auto-discovery](#)<sup>190</sup>, many useful sensors will be created automatically. There are several pre-configured host hardware sensors available out of the box in PRTG:

- [VMware Host Hardware \(WBEM\) Sensor](#)<sup>[1401]</sup>: monitors an ESX(i) server via Web-Based Enterprise Management (WBEM)
- [VMware Host Hardware Status \(SOAP\) Sensor](#)<sup>[1407]</sup>: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- [VMware Host Performance \(SOAP\) Sensor](#)<sup>[1413]</sup>: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- [Hyper-V Host Sensor](#)<sup>[590]</sup>: monitors via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device
- [Citrix XenServer Host Sensor](#)<sup>[343]</sup>: monitors via Hypertext Transfer Protocol (HTTP)
- [SCVMM Host Sensor](#)<sup>[842]</sup>: monitors, for example, a Hyper-V host, a VMware host, or a XenServer host which is managed by a System Center Virtual Machine Manager (SCVMM)

These sensor types monitor hardware specific counters to ensure that no hardware issues affect your actual virtual machines. Additional sensor types can monitor the host hardware via SNMP (for example, traffic and custom requests) and SSH (for example, disk space of VMware ESX(i) servers), as well as there are sensors for network adapters and storage devices which are connected to a Hyper-V host server. You can also monitor Virtuozzo host servers with sensors for network usage and disk space for each container.

## Devices for Virtual Machines

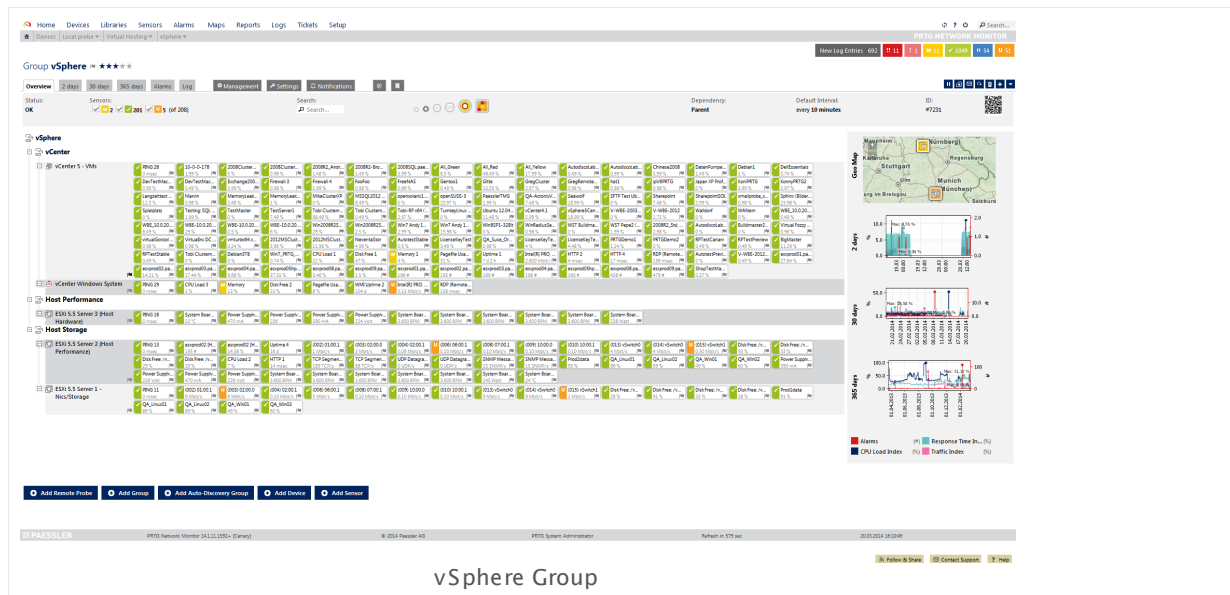

In order to monitor your actual virtual machines, add them to your host servers in PRTG. For a better overview, you might want to add another device to PRTG which represents your host server and add sensors for your VM to there. The according sensors for virtual machines will show you the performance of single VMs as well as their usage of resources. This will help you identify VMs with poor performance and react proactively before one or more VMs crash. As mentioned above, you can additionally monitor your particular VMs from the inside (i.e., the operating systems on your VMs) if necessary. See the sections below for details about particular virtualization solutions.

### VMware Virtual Machine

PRTG's [VMware Virtual Machine \(SOAP\) Sensor](#)<sup>[1419]</sup> monitors VMs on a VMware host server via Simple Object Access Protocol (SOAP). With the VMware system, the general idea is to add a **vCenter** server as a device to PRTG and use the vCenter as parent device where you add the sensors to for your virtual machines. So, in the case of **vMotion** when your VMs change their host server, PRTG will be able to follow these movements and will never lose the monitored VMs.

For this sensor type, you need the **Microsoft .NET Framework** with the latest update of version 4.0 running on the probe machine. If you use many VMware sensors, we also recommend adjusting the settings on your VMware host server to accept more incoming connections.

## Part 10: Sensor Technologies | 10 Monitoring Virtual Environments

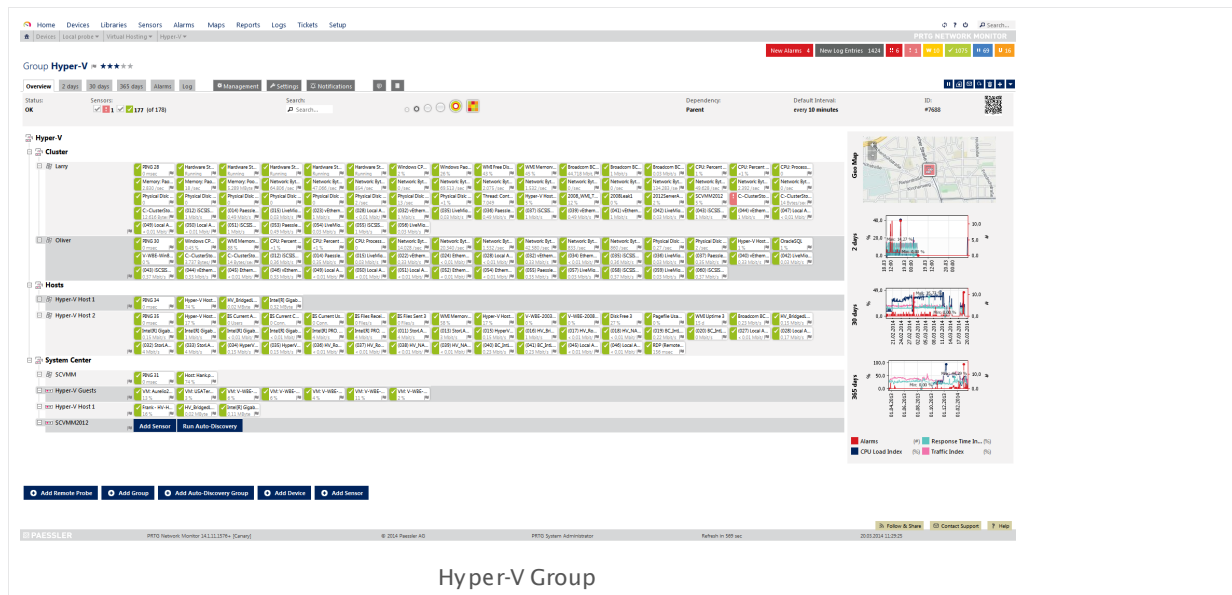

This screenshot shows a sample vSphere group in PRTG. As recommended, the VMware virtual machines are added to the vCenter device. There is also a dedicated device for the vCenter Windows operating system with common WMI sensors for CPU, memory, disk, and network usage. The ESXi host servers are organized in their own groups regarding performance and storage. In this example, PRTG monitors the hosts with the standard SNMP hardware sensors as well as with the specific VMware ESXi host sensors.

## Microsoft Hyper-V Virtual Machine

PRTG's [Hyper-V Virtual Machine Sensor](#)<sup>596</sup> monitors VMs via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. With this hybrid approach, the sensor first tries to query data via performance counters and uses WMI as a fallback if there are no performance counters available. Performance counters in general need less system resources than WMI. We recommend using System Center Virtual Machine Manager (SCVMM) as parent device for this sensor type, because when your VMs change their physical host with **Live Migration**, this sensor will still be able to continue monitoring. You should also disable User Account Control (UAC) in the Windows operating system of the VM.

## Part 10: Sensor Technologies | 10 Monitoring Virtual Environments

This screenshot shows a sample Hyper-V group in PRTG. There is a dedicated group for failover clustering where two nodes are monitored with several SNMP and WMI sensors, as well as [Hyper-V Host Server sensors](#)<sup>[590]</sup> and sensors for the Hyper-V virtual machines. This ensures that Hyper-V and failover clustering works without any issues. The Hyper-V hosts are monitored the same way, organized in a dedicated group for hosts.

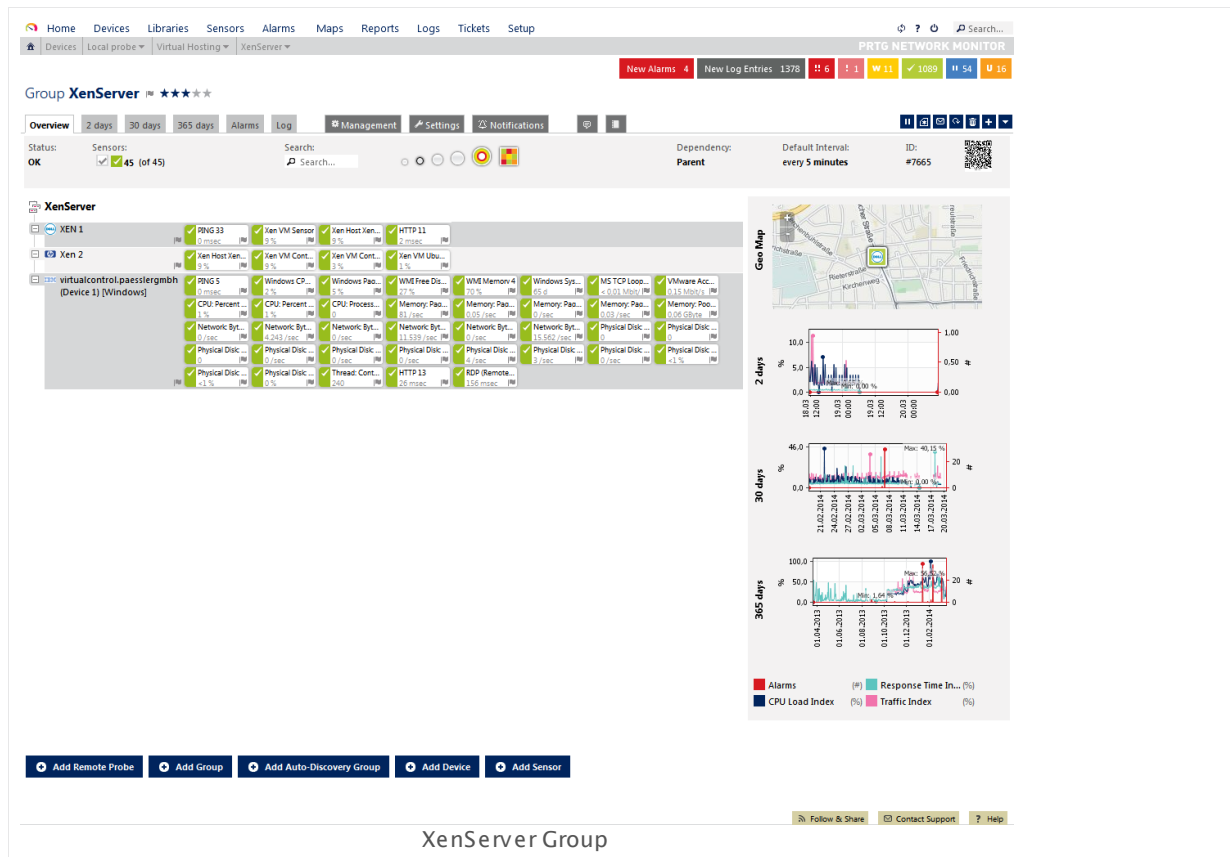

Note that we recommend adding the particular virtual machines to the SCVMM server if possible! We pointed out above that you should add the VMs to an SCVMM server to avoid issues with Live Migration. You can see this in the group "System Center". The particular VMs are added to the dedicated device "Hyper-V Guests". The SCVMM itself is monitored as described below.

## Citrix XenServer Virtual Machine

PRTG's [Citrix XenServer Virtual Machine Sensor](#)<sup>[349]</sup> monitors VMs via Hypertext Transfer Protocol (HTTP). For this sensor type, you have to add a device to PRTG which represents a Citrix XenServer with version 5.0 or later. Another requirement is the **Microsoft .NET Framework**: You have to run the latest update of version 4.0 on the probe machine where you add this sensor to.

In a XenServer pool, every host knows each running VM. Because of this, there is no central instance which provides all available data so it does not matter on which host you query your VMs. All queries on any host are automatically forwarded to the pool master which manages the XenServer pool. So it is sufficient to create the desired sensors for your XenServer VMs on a device that represents one host server of your pool. PRTG's XenServer sensors can figure out by themselves which host is running and retrieve the according data.

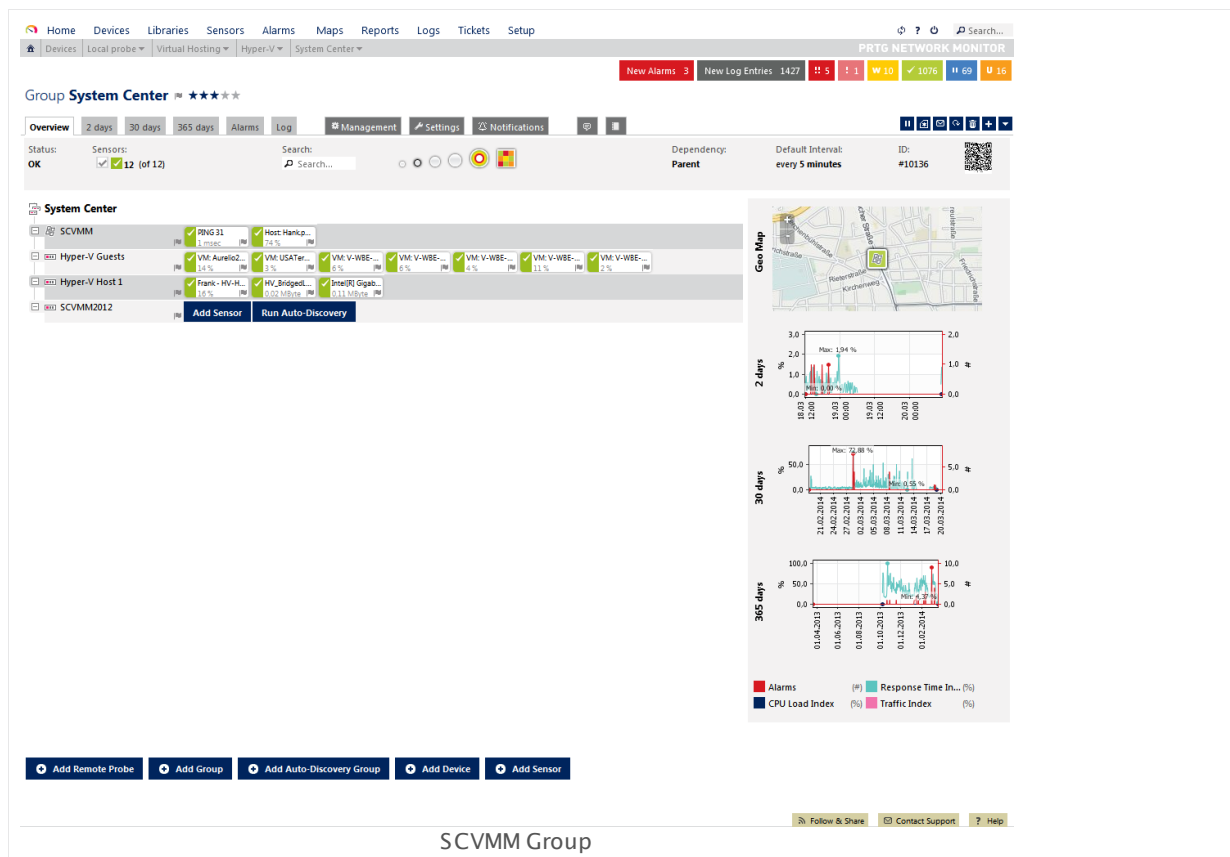

## Part 10: Sensor Technologies | 10 Monitoring Virtual Environments

This screenshot shows a sample XenServer group in PRTG. There are two devices for XenServer hosts (Xen 1 and Xen 2), each with a [Citrix XenServer Host sensor](#)<sup>[343]</sup> and several [Citrix XenServer Virtual Machine sensors](#)<sup>[349]</sup> for the particular VMs on this host. Furthermore, the Windows operating system is represented as a dedicated device ("virtualcontrol") which is monitored with several WMI sensors regarding CPU, disk, memory, and network usage.

## Microsoft SCVMM Virtual Machine

With the [SCVMM Virtual Machine Sensor](#)<sup>[849]</sup> you can monitor VMs which are managed by a System Center Virtual Machine Manager (SCVMM), for example, Hyper-V or VMware. Requirements for this sensor type to work are the [Microsoft .NET Framework](#) with version 4.0 and the latest update, [Remote PowerShell 2.0](#), and the [VMM PowerShell Plugin](#). If you add your SCVMM server to PRTG, PRTG will be able to follow movements of your VMs automatically.

This screenshot shows a group for an SCVMM server in PRTG which manages Hyper-V virtual machines. The SCVMM server is monitored with the [SCVMM Host sensor](#)<sup>[842]</sup> which shows several kinds of server states and usage parameters. Several virtual machines are added to the "Hyper-V Guests" device (as SCVMM Virtual Machine sensors) so that PRTG can automatically detect changed VM host devices.

The sensor types described in this section monitor virtual machine specific counters in order to ensure that all your VMs have enough resources available. If a VM is overloaded, PRTG can notify you immediately and you can proactively take care of issues before a particular VM has an outage or other failures. Additionally, we have shown an idea for a structured virtual monitoring with several recommendations.

You can find all available sensors for virtual servers and the according virtual machines in section [List of Available Sensor Types—Virtual Servers Sensors](#)<sup>[296]</sup>.

- [Monitoring Virtual Environments](#)  1978
- [Monitoring Databases](#)  1987
- [Monitoring Syslogs and SNMP Traps](#)  1989

## 10.11 Monitoring Databases

Monitoring your databases enables you to ensure that, on the one hand, database queries are processed in time, and, on the other hand, that the database itself performs within the defined parameters. Furthermore, database monitoring with PRTG makes it possible to be alerted via a corresponding sensor status if database queries return an unexpected result value.

PRTG comes with built-in native sensors for the most common databases:

- Microsoft SQL servers
- MySQL servers
- Oracle SQL servers

However, it is possible to monitor many other database servers. For this concern, PRTG uses the ActiveX Data Objects (ADO) interface in combination with the PowerShell scripting language.

There are two types of database sensors:

- [Sensors monitoring databases directly](#)<sup>[1987]</sup>: They monitor from the user perspective, sending a request to the database server and receiving values. These values can optionally be compared to the expected values to ensure they match.
- [Sensors monitoring database performance](#)<sup>[1988]</sup>: They have a more abstract view on database servers and monitor performance counters via Windows Management Instrumentation (WMI).

### Sensors Monitoring Databases Directly

PRTG provides several sensors which can "look into" the content of databases. Sensors of this type connect to the database server and show the response time. In addition, these sensors can read out the number of records and a value, depending on an SQL query.

The following sensors are available for this kind of monitoring:

- [Microsoft SQL Sensor](#)<sup>[685]</sup>: can monitor Microsoft SQL servers (MSDE, SQL Server 7, 2000, 2005, 2008, and 2012).
- [MySQL Sensor](#)<sup>[693]</sup>: can monitor MySQL servers (3.23, 4.0, 4.1, 5.0, and 5.1)
- [Oracle SQL Sensor](#)<sup>[732]</sup>: can monitor Oracle SQL servers (7.3, 8.0, 8i, 9i, 10g, and 11g). **Note:** You have to provide all necessary information manually, in contrast to the other SQL sensors listed above.
- [ADO SQL Sensor](#)<sup>[316]</sup>: can monitor almost all available database servers, as well as data files via an ActiveX Data Objects (ADO) connection and a PowerShell script.

For these sensors you can define a valid SQL statement that will be sent to the database server. With every scanning interval, the sensor will execute the query against the database and a corresponding value will be returned. You can indicate in the sensor settings whether you want to post-process this result and specify the intended sensor behavior for the received value ("Warning" status, "Down" status).

## Sensors Monitoring Database Performance

Performance sensors for database servers have a more "abstract" view on databases and regard performance "from the outside". They do not read out any values of the database, neither do they send SQL queries to databases. This sensor type is only available for Microsoft SQL servers.

These sensors monitor Microsoft SQL servers' performance via Windows Management Instrumentation (WMI). You can manually set up different performance counters for your server instances, for example, general statistics, access methods, buffer and memory manager, locks, and SQL statistics.

Microsoft SQL Server performance sensors are available for Microsoft SQL Server 2008 and 2012:

- [WMI Microsoft SQL Server 2008 Sensor](#)  1607
- [WMI Microsoft SQL Server 2012 Sensor](#)  1615

## 10.12 Monitoring Syslogs and SNMP Traps

PRTG is utilizable as a full scale syslog server and SNMP trap receiver. Every PRTG installation includes this functionality so no additional software is needed. This manual section describes a sample configuration for PRTG's syslog and SNMP trap receiver and gives you an idea about how to use these features.

Syslog is a well-established standard for computer message logging. Many network devices support sending syslogs to communicate informational, analysis, and debugging messages which are intended for network management and security auditing. SNMP traps are asynchronous notifications from SNMP-enabled devices and can be used to report important incidents and data, just like syslog messages. Devices trigger these messages for various reasons, such as system events, outages, critical conditions, and many more.

PRTG provides two dedicated sensor types which work as full scale syslog resp. SNMP trap receivers:

- [SNMP Trap Receiver Sensor](#)  1287
- [Syslog Receiver Sensor](#)  1364

Because both the syslog and the trap receiver are implemented as common sensor types, you do not need to install software in addition to PRTG (for example, you do not need an extra syslog server but only the PRTG web server). You can create the Syslog Receiver as well as the SNMP Trap Receiver sensors in the usual PRTG way via the [add sensor](#)  220 dialog. Then configure your syslog- or SNMP trap-enabled device(s) to send messages to PRTG.

PRTG is able to handle about 10,000 syslog and trap messages per second on a quad core desktop machine. You can filter the incoming messages by various parameters so that PRTG will process only specific messages and purge other data right away. Processed messages are stored in an internal high-performance database on the particular probe machine and are available for reviewing and analyzing via PRTG's web interface. The main limiting factor for PRTG's syslog and trap receivers is the hard disk space on the machine running the PRTG probe with these sensors.

### Sample Configuration

Follow the steps below for a sample configuration of Syslog and SNMP Trap Receiver sensors. You can apply these instructions to both the SNMP Trap Receiver as well as the Syslog Receiver because the setup works in a similar way for both.

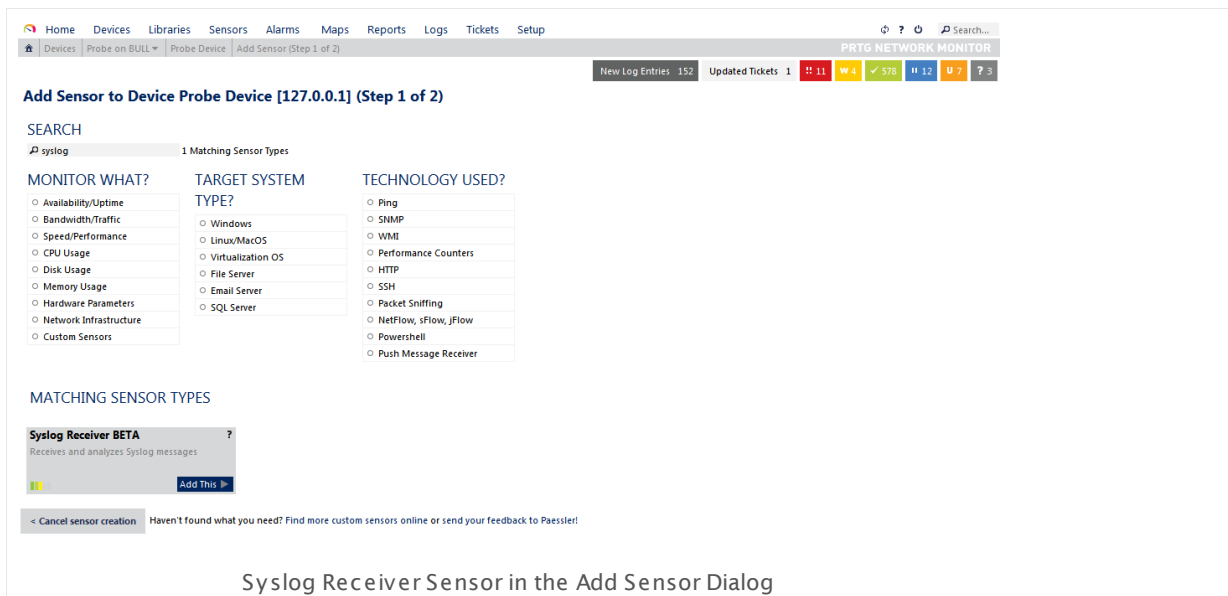

1. [Adding the Receivers](#)  1990
2. [Configure the Source Devices](#)  1990
3. [Collect Messages](#)  1991
4. [Review and Analyze Messages](#)  1989
5. [Refine the Filters](#)  1993
6. [Create Notification Triggers](#)  1994

**Step 1: Add a Syslog Receiver or SNMP Trap Receiver sensor to PRTG.**

Both sensor types inherit an implicit filter by the IP address of the parent device. So, on the one hand, it is possible to add these sensors to a [probe device](#)<sup>[85]</sup>. Then you will receive all messages from the system running the probe and can optionally filter for specific sources later. On the other hand, you can add these sensors directly to the source device. Then only messages from this device will be processed.

Add the receiver sensors to the desired device in the common way, for example, via the device's [context menu](#)<sup>[168]</sup>. We recommend leaving the sensor's default settings unchanged for the first configuration (port, include and exclude filter, warning and error filter) to see what data actually comes in.

**Note:** Adding the sensor to a network device directly will increase its speed in comparison to a filter definition in the sensor settings. Distributing Syslog and SNMP Trap Receiver sensors over different probes will make the overall performance scalable and gives you variability for the place of [data storage](#)<sup>[2074]</sup>.

Syslog Receiver Sensor in the Add Sensor Dialog

**Step 2: Configure your network device(s) which support sending syslogs or SNMP traps appropriately.**

Configure your syslog or SNMP trap ready devices to send syslogs or traps (see documentations of the respective device vendors). They have to address the PRTG probe on which your Syslog or SNMP Trap Receiver sensor runs. So specify the IP address of the machine with the respective PRTG probe. If you keep your syslog or trap receiver's default settings, use the port 514.

**Note:** The protocol is User Datagram Protocol (UDP).

Filter are formulas using **AND**, **OR**, **NOT**, brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/255]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2], facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4], severity[1-3]
hostname[host]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[tag]	Enter the tag string to match (exact, case sensitive)	tag[xu]
appname[app]	Enter the app name string to match (exact, case sensitive)	appname/myproc
procid[pid]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[msgid]	Enter the message ID string to match (exact, case sensitive)	msgid[047]
message[part]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[part]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSOD@32473], data[exampleSOD@32473.eventSource], data[exampleSOD@32473.eventSource.Application]

Implicit Device Filter: This sensor inherits an implicit filter by the IP address of the parent device

Include Filter: severity[0-6]

Exclude Filter:

Warning Filter: severity[4]

Error Filter: severity[0-3]

Continue > Cancel

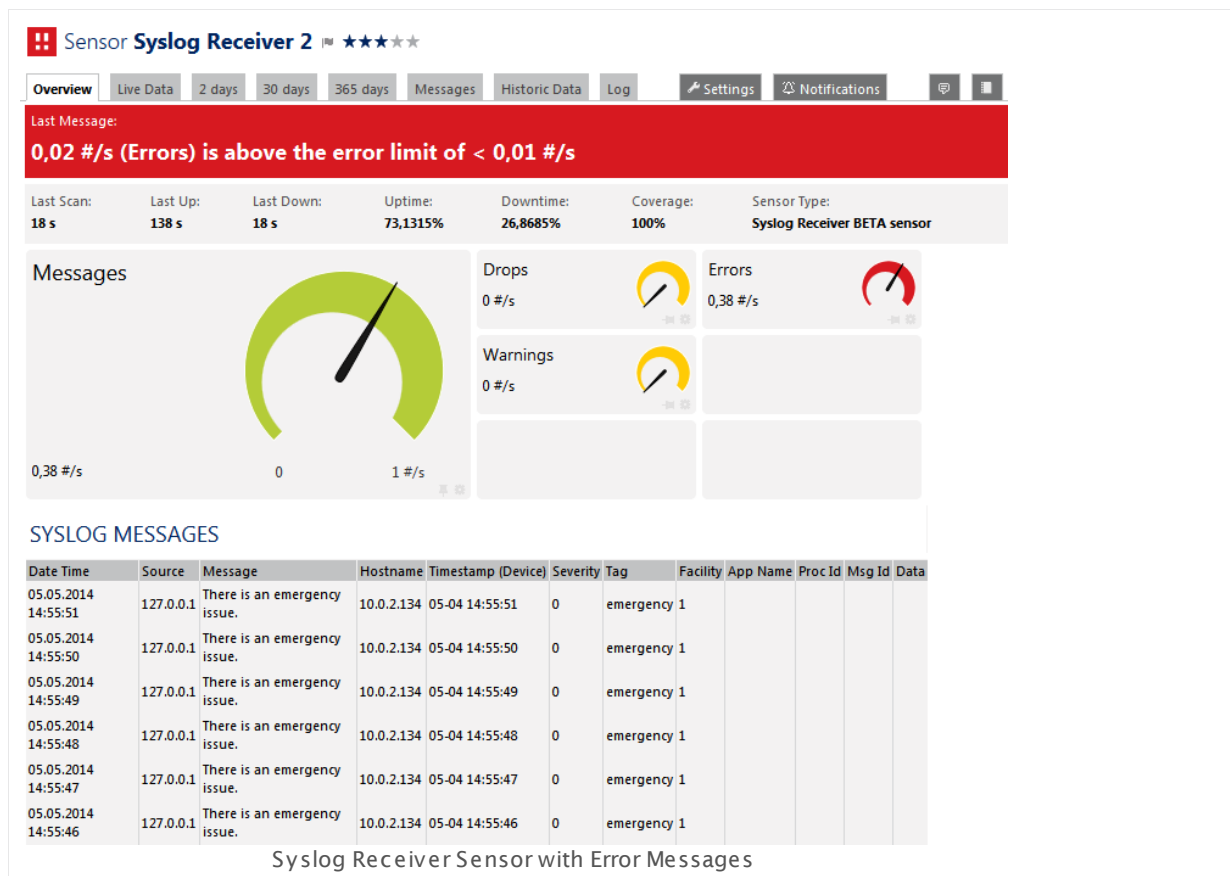

Default Sensor Settings: Sufficient for the First Configuration

### Step 3: Start collecting syslog or SNMP trap messages from your devices.

You do not have to accomplish any further configuration steps to use PRTG as a syslog server or SNMP trap receiver. When your device(s) send syslogs or SNMP traps to the specified PRTG probe machine, the messages will appear automatically in PRTG's web interface. After each sensor scan (by default inherited from the parent device), PRTG will count the received syslogs or traps in the according channels (total number of messages during the last interval, error and warning messages, or dropped packets).

Let the syslog receiver or the SNMP trap receiver collect data for a while to see what comes in. By default, the respective sensor will go into a **Warning** status if there was at least one message with **severity 4** and into an **Error** status if there was at least one message with **severity 3 or lower** during the last sensor scan.

**Note:** Incoming messages are counted per scanning interval, so it might take a few moments to see the received syslogs/traps, depending on the remaining time until the next sensor scan. Of course, you can use **Check Now** via the sensor's [context buttons](#) <sup>113</sup> to perform an immediate scan and see corresponding data. The sensor states are also defined per scan. So, for example, a message which is classified as error will count for the error channel only for one scanning interval; if there is no new error message in the following scanning interval, no message is shown in the error channel anymore and the error **status** will disappear after the next sensor scan. The syslog or trap itself will still be accessible on the **Messages** tab.

#### Step 4: Review and analyze the collected data.

All incoming messages which match the include filter are processed and stored in PRTG's internal high-performance database. Review and analyze the received syslogs and traps via PRTG's web interface. For details, see the respective manual sections of [SNMP Trap Receiver Sensor](#)<sup>[1274]</sup> and [Syslog Receiver Sensor](#)<sup>[1371]</sup>. Then you can decide about further filtering of the incoming messages.

**Note:** The received data is also available in PRTG's [data folder](#)<sup>[2074]</sup> as common files. One data file is created per hour.

**Note:** For the SNMP Trap Receiver sensor, you can add the Management Information Base (MIB) files of your device(s) to the **\MIB** subfolder of PRTG. This will result in Object Identifier (OID) resolution and makes trap messages more comprehensible.

## Part 10: Sensor Technologies | 12 Monitoring Syslogs and SNMP Traps

The screenshot shows the PRTG Network Monitor interface for the 'Sensor Syslog Receiver 2'. The 'Messages' tab is active, displaying a table of received syslog messages. The table has the following columns: Source, Message, Hostname, Timestamp (Device), Severity, Tag, Facility, App Name, ProcId, MigId, and Data. A filter is applied to show emergency messages from 10.0.2.134. The table shows multiple entries of emergency messages from 10.0.2.134, all with a severity of 0 and a tag of 'emergency'. The messages are timestamped from 05-05-2014 14:55:50 to 05-05-2014 14:54:43. The interface also shows a search bar, navigation tabs, and a footer with the PRTG logo and version information.

Received Syslogs on the Messages Tab

**Step 5: (Optionally) refine the filters.**

In order to enhance the productivity with your PRTG syslog servers and trap receivers, you can adjust the default filter settings. PRTG provides you a comprehensible formula system that you can use to describe which kind of messages you want to process and which of them will count as error or warning messages. You can configure the following filters for received messages in the settings of the respective receiver:

- **Include** filter: Process and store specific types of messages only.
- **Exclude** filter: Do not process specific types of messages and discard them.
- **Warning** filter: Define rules to categorize received messages as warnings.
- **Error** filter: Define rules to categorize received messages as errors.

Use the syntax which is provided in the corresponding manual sections to define your individual filter rules: [SNMP Trap Receiver Sensor](#)<sup>[1273]</sup> and [Syslog Receiver Sensor](#)<sup>[1370]</sup>.

**Note:** You can create filter rules with a few mouse clicks using the **Advanced Filter** on the **Messages** tab of a specific sensor and copy these rules into the sensor settings to apply them.

Advanced Filter

```
(hostname[10.0.2.134]) AND (severity[0]) AND (tag[emergency])
```

Filter are formulas using AND , OR, NOT , brackets and the following fields:

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50] , source[10.0.23.10-50] , source[10.0.23.10/255]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2] , facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4] , severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473] , data[exampleSDID@32473,eventSource] , data[exampleSDID@32473,eventSource,Application]

OK

Cancel

Advanced Filter Created on the Messages Tab

### Step 6: (Optionally) create notification triggers.

By default, the warning and error channels of the Syslog and SNMP Trap Receiver sensors have a very low upper warning resp. error limit (0.00000001). The reason for this is that even when only one syslog or trap has been counted in the respective channel during a scanning interval, the overall status of the sensor will show this with the corresponding status. This way, you will always recognize if there is something wrong on the monitored system.

Because of this sensor behavior, best practice would be to add a **State Trigger** on the [Notifications](#)<sup>1749</sup> tab of the sensor if you want to get a [notification](#)<sup>92</sup> when a warning or error message type comes in. Define a very low **Down** or **Warning** time condition to not miss any warnings or errors to not miss any messages, for example **0 seconds**. Another option would be a **Speed Trigger** for notifications regarding messages per second.

**Note:** You can use syslog and trap specific placeholders in notification templates in order to see the messages when you receive a notification. See the [More](#)<sup>1995</sup> section below for more information.

## System Administration Tools

# 11 System Administration Tools

Using the two applications **PRTG Server Administrator** and **PRTG Probe Administrator** from the Windows start menu, you can edit administrative settings that affect your PRTG installation, the local probe running with it, or a remote probe installation. All settings will require a restart of the Windows services for changes to take effect. Please see these following sections.

**Note:** You can also change many administrative settings via the [Setup](#)  in PRTG's web interface.

## System Administration Programs—Topics

- [PRTG Server Administrator](#)  1999
- [PRTG Probe Administrator](#)  2016

## Related Topics

- [Setup](#)  1810
- [Failover Cluster Step by Step](#)  2067

## 11.1 PRTG Server Administrator

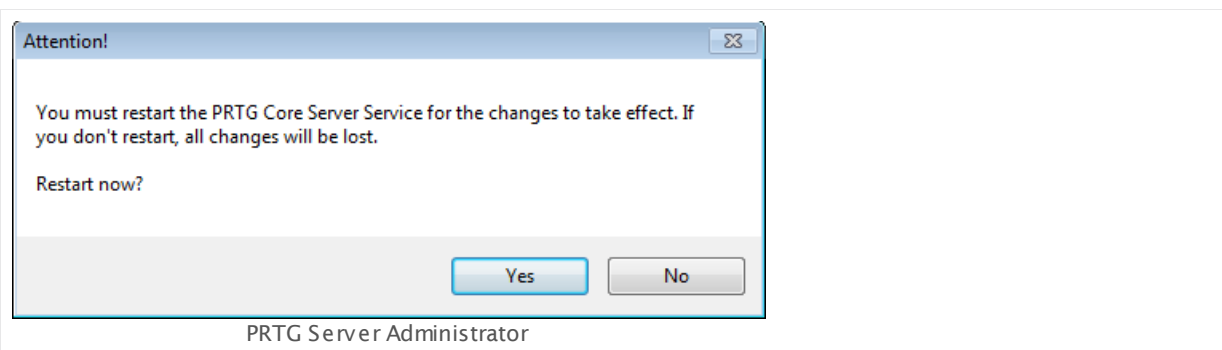

In the PRTG Server Administrator program you can define different system-oriented settings that affect your PRTG installation, as well as restart services and view log information. **Note:** To get familiar with the different components of PRTG, we recommend reading the [Architecture](#) <sup>177</sup> section.

**Note:** All settings made here are only valid for the local installation running on the computer you're opening the program on. In order to change settings for another installation, for example, another cluster node installation, please log in to this computer and open the program there. You can change many of these settings also via the [system administration](#) <sup>1810</sup> in PRTG's web interface.

From the **PRTG Network Monitor** group in Windows start menu, please select **PRTG Server Administrator** to open the application. You can choose from these options in different tabs:

- [Web Server](#) <sup>1999</sup>
- [Core Server](#) <sup>2002</sup>
- [Cluster](#) <sup>2004</sup>
- [Administrator](#) <sup>2010</sup>
- [License](#) <sup>2011</sup>
- [Start/Stop](#) <sup>2012</sup>
- [Logs](#) <sup>2013</sup>
- [About](#) <sup>2015</sup>

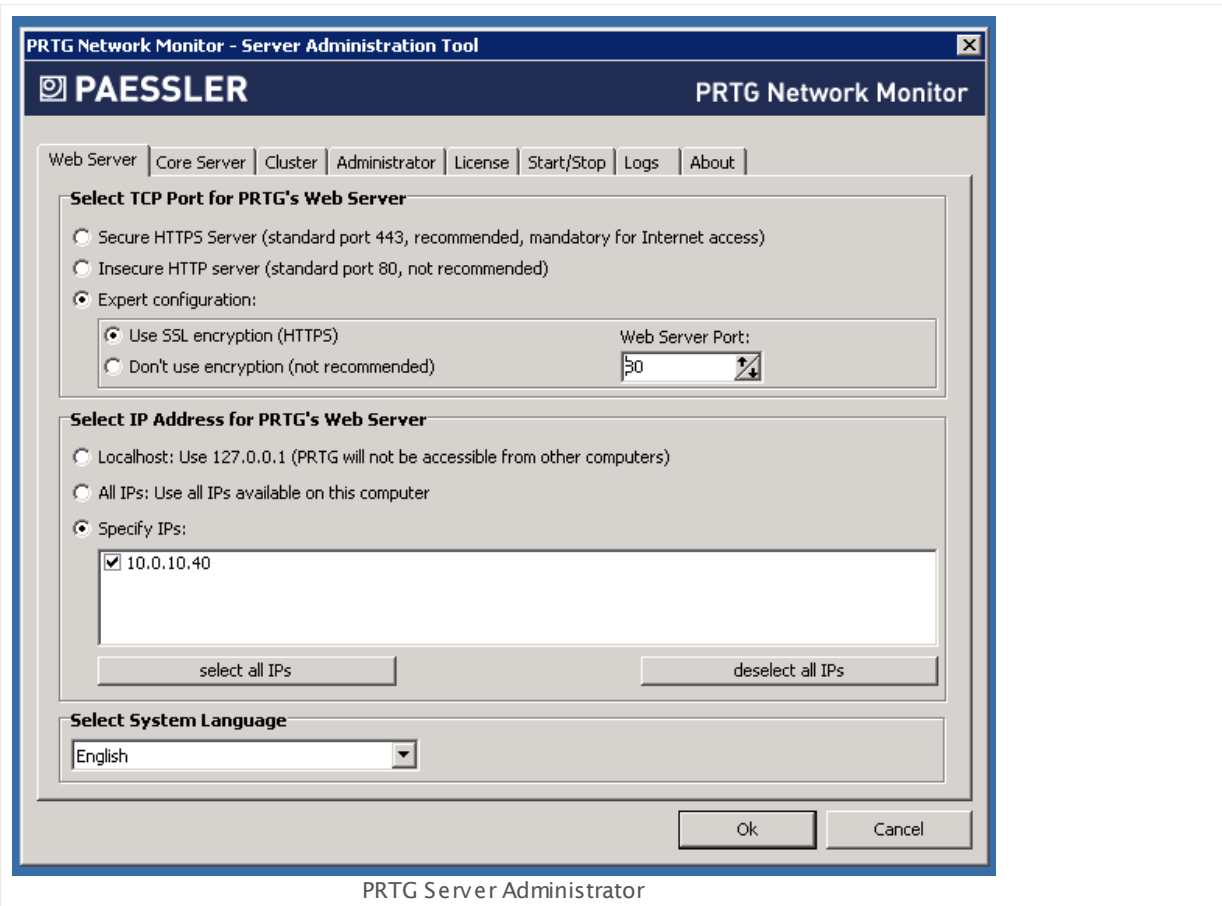

When closing the program using the **Ok** button, you are asked to restart the core server Windows service in order to save the settings. Please confirm by clicking the **Yes** button. Otherwise the changes are ignored.

### Web Server

Edit IPs, ports, access methods and language for the [Ajax](#) <sup>100</sup> and [Mobile Web GUI](#) <sup>1947</sup> web interfaces.

**Note:** You can change all settings which are on the **Web Server** tab also via PRTG's web interface under **Set up | System Administration | User Interface** <sup>1832</sup>.

## Web Server—Select TCP Port for PRTG's Web Server

PRTG is running a web server in order to provide the web and Windows interface. Please specify on which port this web server will run.

### Secure HTTPS Server (standard port 443, recommended, mandatory for internet access)

- This is the recommended setting.
- Use a secure HTTPS connection that is encrypted via SSL on port 443.
- **Note:** Although the connection is secure, you will see an **SSL Certificate Warning** <sup>105</sup> in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** <sup>2076</sup>.
- **Note:** If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior using a registry setting.

### Insecure HTTP server (standard port 80, not recommended)

- This setting is not recommended for WAN connections.
- Use a standard web server without SSL encryption on port 80.
- **Note:** If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.

### Expert configuration

- This setting allows you to specify a custom web server port and the security of the connection.
- This option is intended for systems with an existing web server on the standard port.
- Specify if you want to use an SSL encryption.
- Enter the desired TCP port number you want the PRTG web server to run on. Please enter an integer value.
- **Note:** Although if you choose a secure connection, you will see an [SSL Certificate Warning](#) [105] in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see [Using Your Own SSL Certificate](#) [2076].
- **Note:** If no SSL encryption is used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.

### Web Server—Select IP Address for PRTG's Web Server

PRTG is running a web server in order to provide access via the web and Windows interface. Please specify which IP address this web server will run on. **Note:** Later, you can log into PRTG by simply pointing your browser to the specified IP address.

#### Localhost: Use 127.0.0.1 (PRTG will not be accessible from other computers)

- PRTG's web and Windows interface will only be accessible from the computer PRTG is installed on.
- **Note:** Either the selected port or at least one port in the range from 8080 to 8089 has to be available on 127.0.0.1.

**Note:** If you run PRTG on localhost, please do not use the DNS name <http://localhost> to log in to the web server, as this may considerably slow down PRTG's web interface. Please use your local IP address or <http://127.0.0.1> instead.

#### All IPs

- Use all IP addresses available on this computer and enable access to the web server for all of these addresses.
- **Note:** The TCP port selected above must be free on every available IP address.

### Specify IPs

- Select specific IP addresses on which the PRTG Web server will run on.
- A list specific to your system is shown.
- Add a check mark in front of every IP address you want the PRTG web server to be available at.
- **Note:** Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address.

**Note:** Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports.

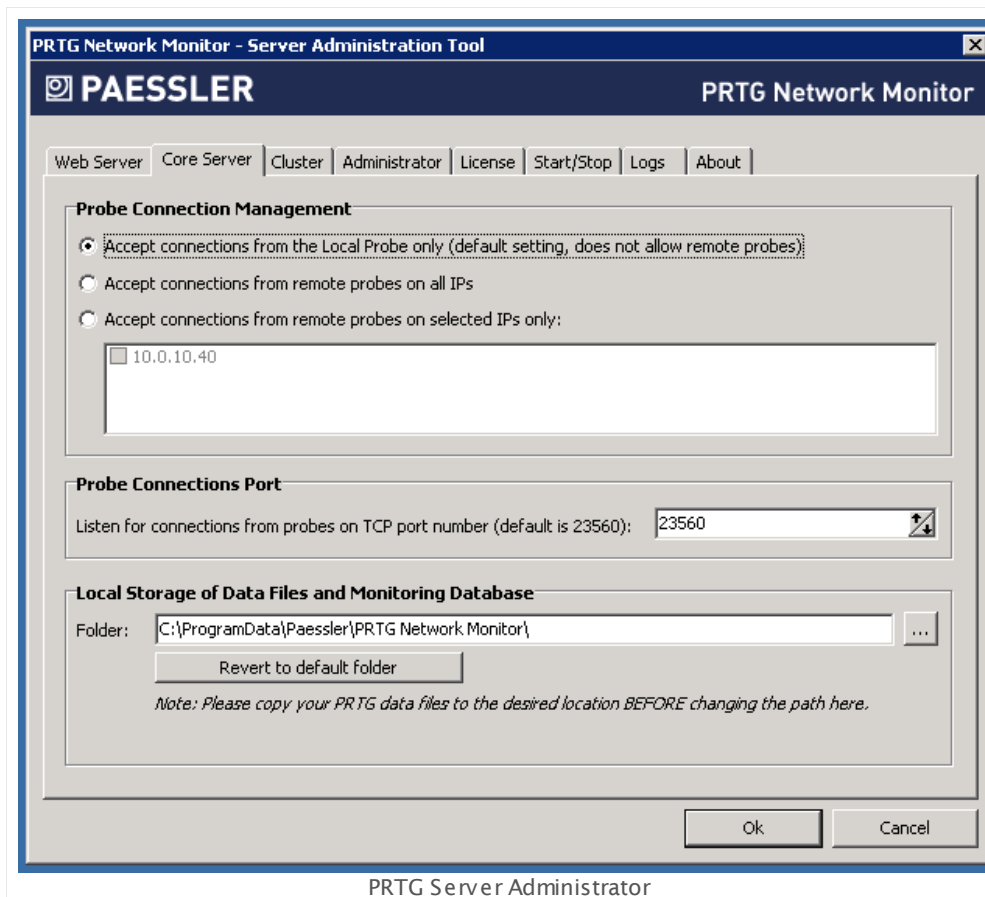

**Note:** If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.

### Select System Language

- Choose the language for this program from the drop down menu. Default is **English**. Depending on your installation, you may be able to choose other languages here.
- This setting will influence the language of this program, as well as the [Ajax](#) <sup>100</sup> and the [Mobile Web GUI](#) <sup>1947</sup> web interfaces.

### Core Server

Define settings for the core server.

PRTG Server Administrator

## Core Server—Probe Connection Management

In this section you can define how PRTG handles incoming connections from probes. Choose between several options.

**Note:** You can change these settings also via PRTG's web interface under **Setup | System Administration | [Core & Probes](#)**.

### Accept connections from the Local Probe only

- This is the default setting.
- Only local probe connections will be accepted by the PRTG core server.
- You cannot use [remote probes](#) with this setting enabled.

### Accept connections from remote probes on all IPs

- Incoming connections from remote probes will always be accepted, no matter on which IP address of the core server they come in.

### Accept connections from remote probes on selected IPs only

- Incoming connections from [remote probes](#)<sup>2059</sup> will only be accepted on the selected IP address(es) of the core server.
- In the list, select the IP addresses by adding a check mark in front the IPs.

### Core Server—Probe Connections Port

In this section you can define on which TCP port number PRTG listens to for incoming probe connections. Enter a port number. We recommend using the default value.

**Note:** You can change this setting also via PRTG's web interface under **Setup | System Administration | [Core & Probes](#)**<sup>1849</sup>.

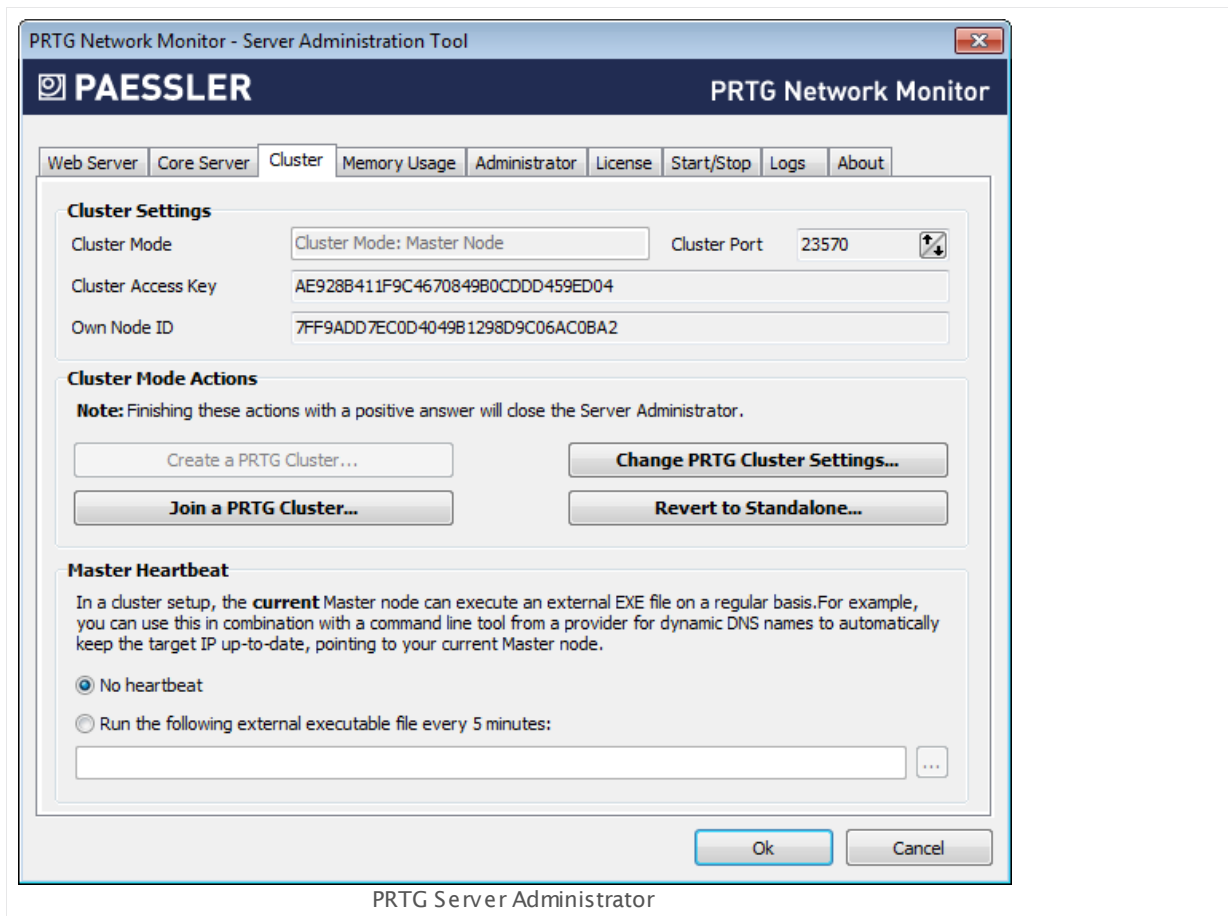

### Core Server—Local Storage of Data Files and Monitoring Database

Define the data folder to which PRTG will store configuration and monitoring data. Define a path or click on the **Revert to default folder** to reset to default. **Note:** Before changing the path, make sure you stop both services and copy all data to the new location.

### Cluster

In the **Cluster** tab you can manually change how the current core installation will behave in a cluster. Before changing settings here, please read [Failover Cluster Configuration](#)<sup>2054</sup> section.

## Cluster—Cluster Settings

Depending on the current cluster settings you will see different information here.

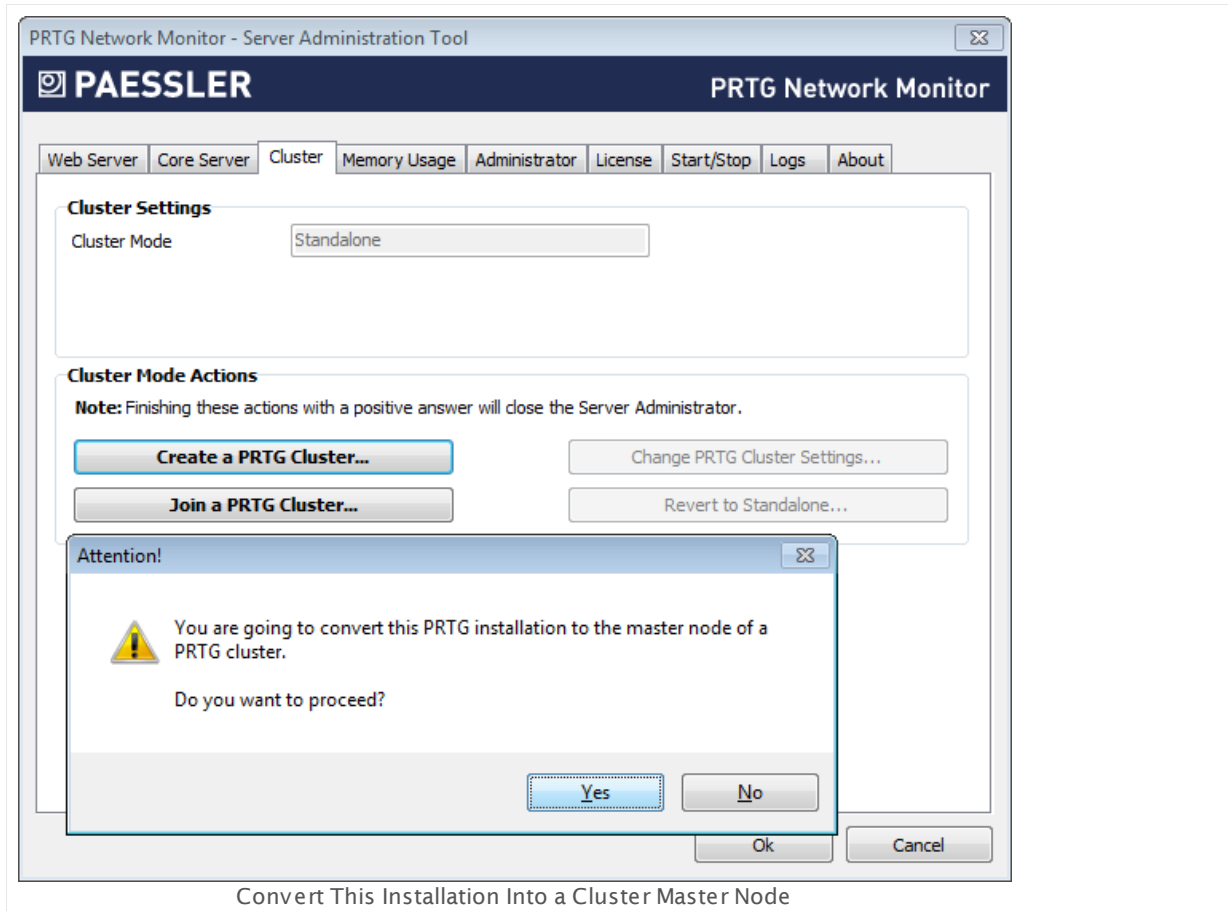

- In the **Cluster Mode** field shows which cluster mode the current installation is running. This setting is shown for your information only and cannot be changed here. Possible values are **Standalone** (no cluster mode), **Cluster Mode: Master Node**, or **Cluster Mode: Failover Node**.
- The **Cluster Access Key** field is shown only when running in a cluster mode. This setting is shown for your information only and cannot be changed here.
- The **Own Node ID** field is shown only when running in a cluster mode. This setting is shown for your information only and cannot be changed here.

## Cluster—Cluster Mode Actions

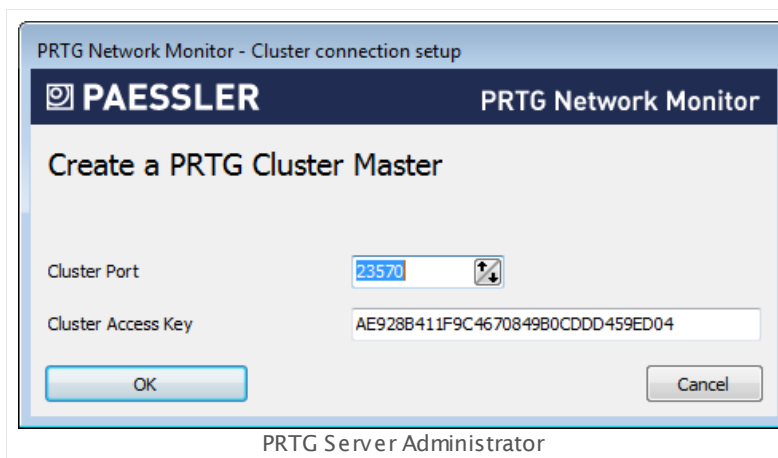

Depending on the current cluster settings you will see different buttons active here.

**Create a PRTG Cluster...**

- Start creating a cluster by clicking this button. The current PRTG core server will then be the **Master Node** of your cluster.
- After you click this button, please confirm converting this installation into a master node by clicking on the **Yes** button.

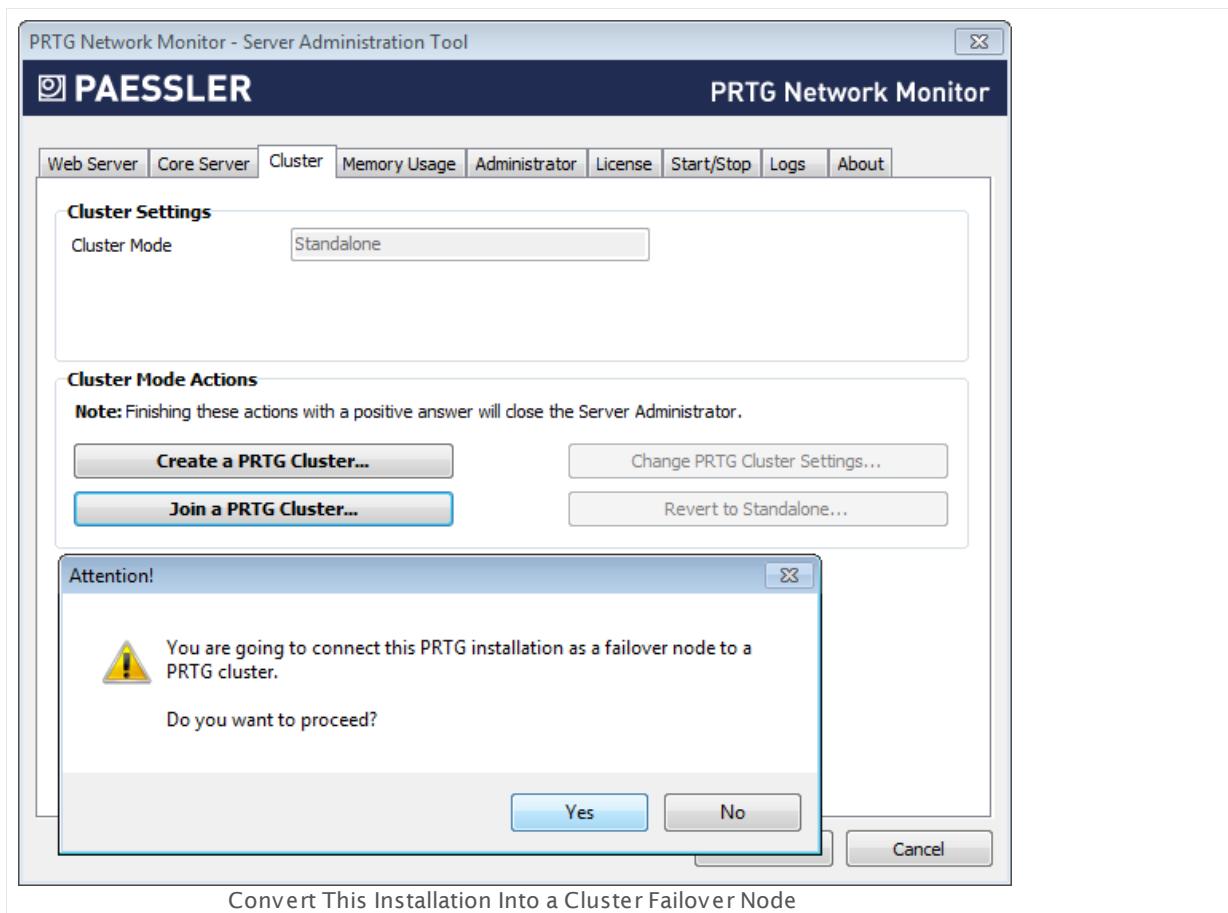

- A new popup window will appear.

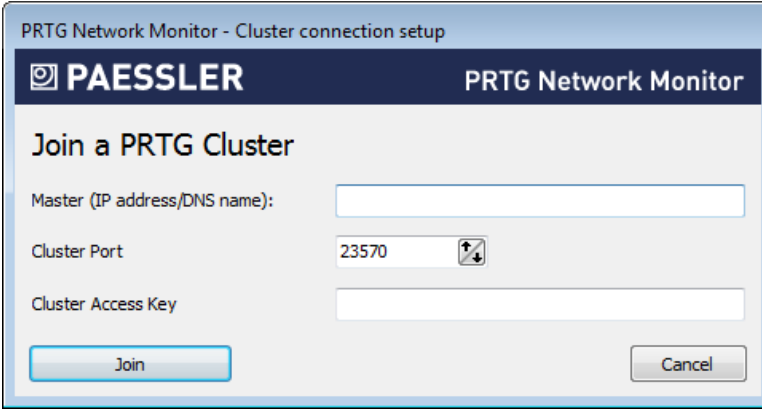

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend using the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your Failover Node (s).
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

### Join a PRTG Cluster...

- Add this installation to an existing cluster which already has a **Master Node**, by clicking this button. The current PRTG core server will then be a **Failover Node** in the cluster.
- **Note:** This button is also available if you're currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- After you click this button, please confirm converting this installation into a failover node by clicking on the **Yes** button.

- A new popup window will appear.

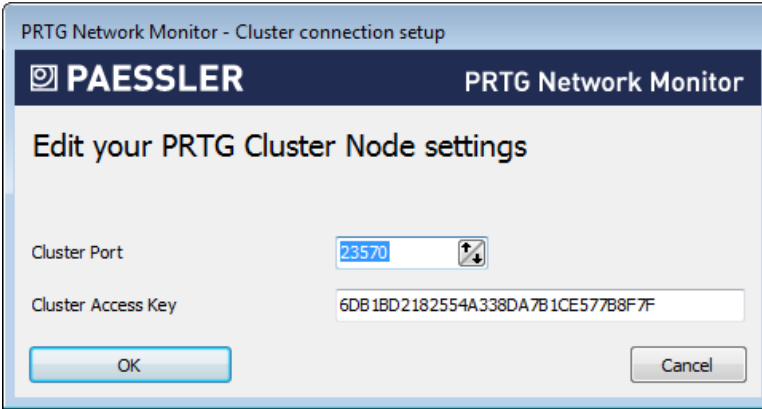

The screenshot shows a dialog box titled "PRTG Network Monitor - Cluster connection setup". The header bar contains the PAESSLER logo and "PRTG Network Monitor". The main title is "Join a PRTG Cluster". Below the title, there are three input fields: "Master (IP address/DNS name):", "Cluster Port" (with a spinner control showing 23570), and "Cluster Access Key". At the bottom, there are two buttons: "Join" and "Cancel".

PRTG Server Administrator

- Enter the cluster's **Master IP address/DNS name**. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in your **Master Node**'s settings. Please make sure you use the same settings on all nodes in your cluster.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

### Change PRTG Cluster Settings...

The screenshot shows a dialog box titled "PRTG Network Monitor - Cluster connection setup". The header bar contains the PAESSLER logo and "PRTG Network Monitor". The main title is "Edit your PRTG Cluster Node settings". Below the title, there are two input fields: "Cluster Port" (with a spinner control showing 23570) and "Cluster Access Key" (containing the text "6DB1BD2182554A338DA7B1CE577B8F7F"). At the bottom, there are two buttons: "OK" and "Cancel".

PRTG Server Administrator

- If you're running your PRTG installation in cluster mode, you can change the settings here. A new window will appear.

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- Please make sure you use the same settings on all nodes in your cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

### Revert to Standalone...

- If you're currently running your PRTG installation in cluster mode, you can change it to **Standalone** mode. If you do so, this node will no longer be part of a cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

### Master Heartbeat

This section is only visible if you're running your PRTG installation in cluster mode. The **current** master can execute an external executable file on a regular basis. We call this a "heartbeat".

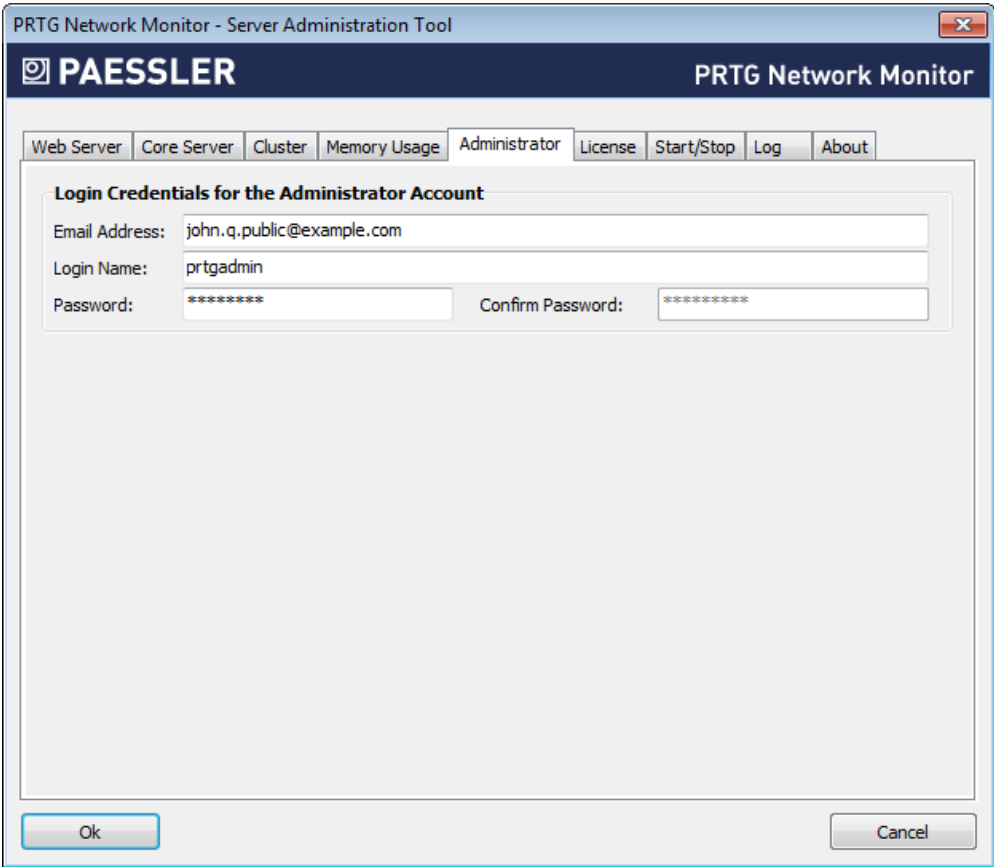

This can be used, for example, to report the IP address of the current master node to a dynamic DNS provider, so a DNS name is always redirected to the current PRTG master node in case the original master node fails and a failover node (running at a different IP address) takes over the master role.

Choose between:

- **No heartbeat**: Do not execute a file on a regular basis.
- **Run the following external executable file every 5 minutes**: Click on the ... button to choose a file you want to execute. This can be, for example, a command line tool, or a batch file. It will be executed on the current master node only, with a fixed interval of five minutes. The interval cannot be changed.

**Note:** Please make sure the selected file is available under the same (local) path on all failover nodes. In case one of your failover nodes becomes current master, the heartbeat can only be executed reliably if the respective executable file exists on all of your failover nodes.

## Administrator

The screenshot shows the 'PRTG Network Monitor - Server Administration Tool' window. The 'Administrator' tab is selected. The form is titled 'Login Credentials for the Administrator Account'. It contains four input fields: 'Email Address' (john.q.public@example.com), 'Login Name' (prtgadmin), 'Password' (masked with asterisks), and 'Confirm Password' (masked with asterisks). At the bottom of the window are 'Ok' and 'Cancel' buttons.

PRTG Server Administrator

Enter the administrator's contact email address and define login credentials for PRTG.

### Email Address

- Enter a valid administrator's email address.
- By default, PRTG will send notifications and important messages to this address.

### Login Name

- Enter a name for the PRTG System Administrator login; this is your default login.
- It is used when logging in to the PRTG Web- or Windows interface.
- The default login name is **prtgadmin**

### Password

- Enter a password for the PRTG System Administrator login; this is your default login.

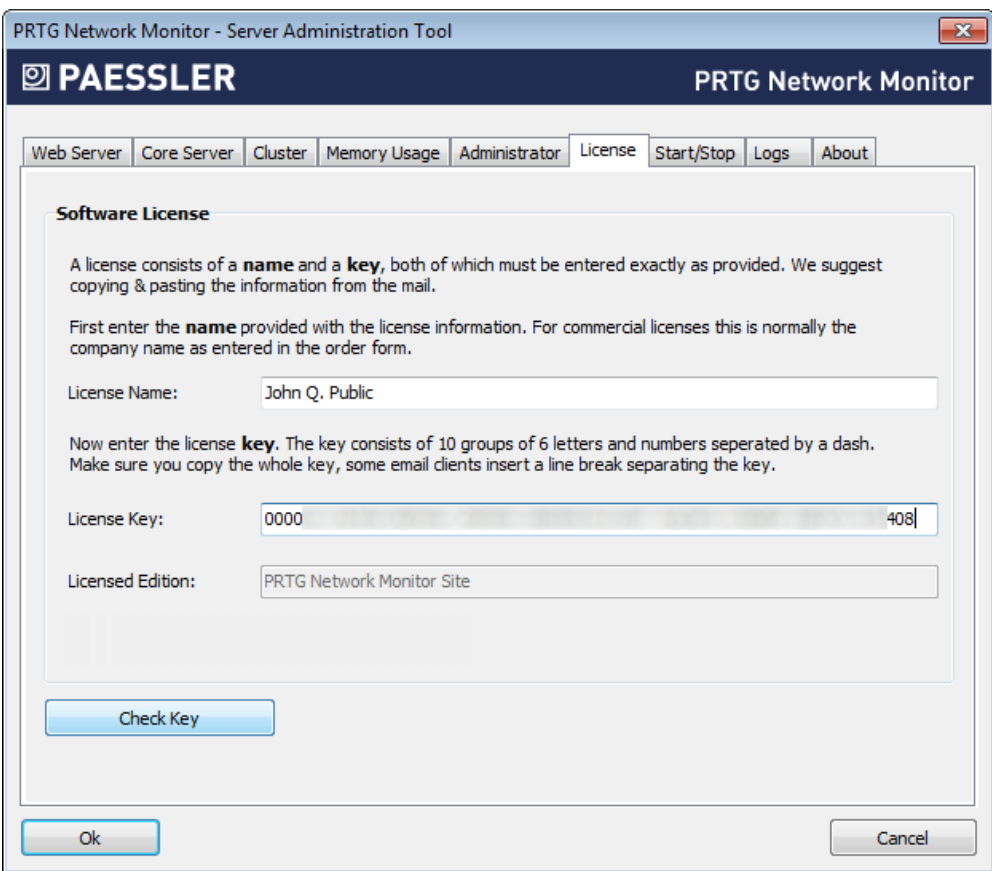

- It is used when logging in to the PRTG Web- or Windows interface.
- The default password is **prtgadmin**

### Confirm Password

- Re-enter the password for the PRTG System Administrator login.
- The default password is **prtgadmin**

### License

To use a PRTG license with this installation of PRTG, please enter the license information you have received from Paessler via email. To avoid typing errors, please copy and paste both the **License Name** and the **License Key** from the email. Both must be transferred exactly as shown in the email.

PRTG Network Monitor - Server Administration Tool

PAESSLER PRTG Network Monitor

Web Server Core Server Cluster Memory Usage Administrator License Start/Stop Logs About

**Software License**

A license consists of a **name** and a **key**, both of which must be entered exactly as provided. We suggest copying & pasting the information from the mail.

First enter the **name** provided with the license information. For commercial licenses this is normally the company name as entered in the order form.

License Name: John Q. Public

Now enter the license **key**. The key consists of 10 groups of 6 letters and numbers separated by a dash. Make sure you copy the whole key, some email clients insert a line break separating the key.

License Key: 0000 408

Licensed Edition: PRTG Network Monitor Site

Check Key

Ok Cancel

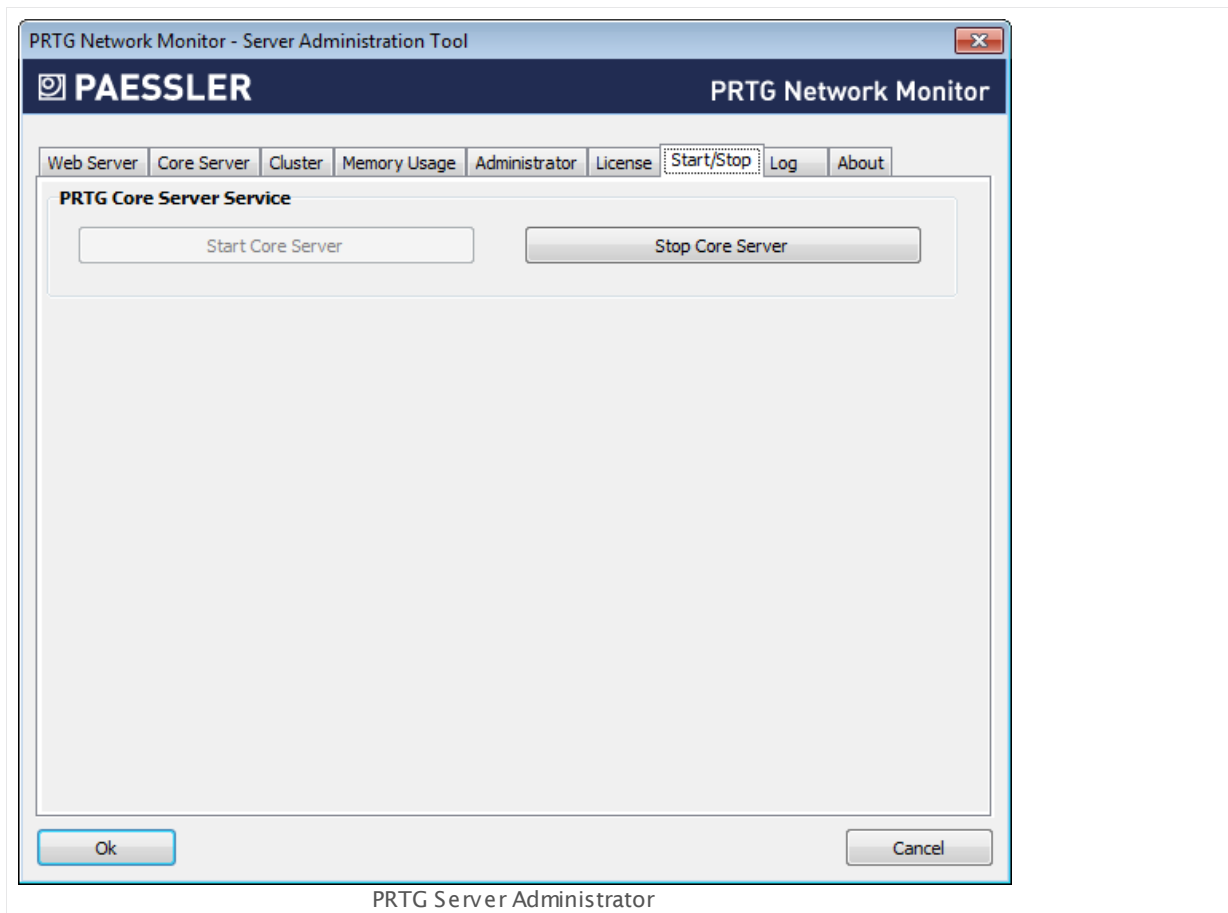

PRTG Server Administrator License Tab

To make sure your key has been entered correctly please click on the **Check Key** button. A popup box will either show success or denial of your license information. License information is also checked if you change tabs.

In the **Licensed Edition** field you will see an accepted license key.

**Note:** You have to use the right edition for your license key. For example, the installer for trial and Freeware edition does not accept any commercial keys. For more information, please see [Enter a License Key](#) <sup>[57]</sup> section.

## Start/Stop

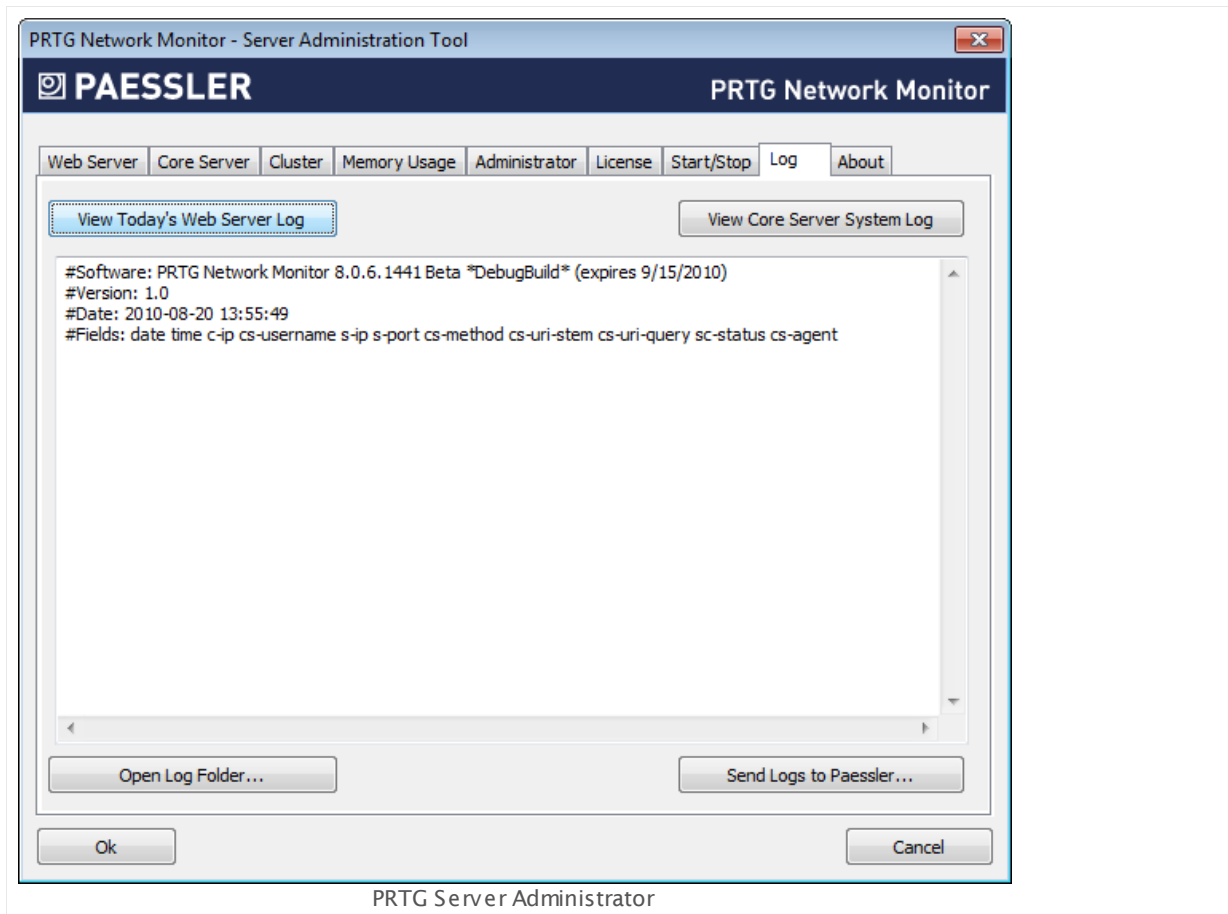

You can stop and start the core server Windows service manually. Click the **Stop Core Server** button to stop the service, and **Start Core Server** to start it again. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server via PRTG's web interface under **Set up | System Administration | Administrative Tools** <sup>[1865]</sup>.

**Note:** If you want to schedule an automatic restart of Windows services for both core server and probe service, please do so using the **PRTG Probe Administrator** <sup>[2019]</sup> (Start/Stop) section.

## Logs

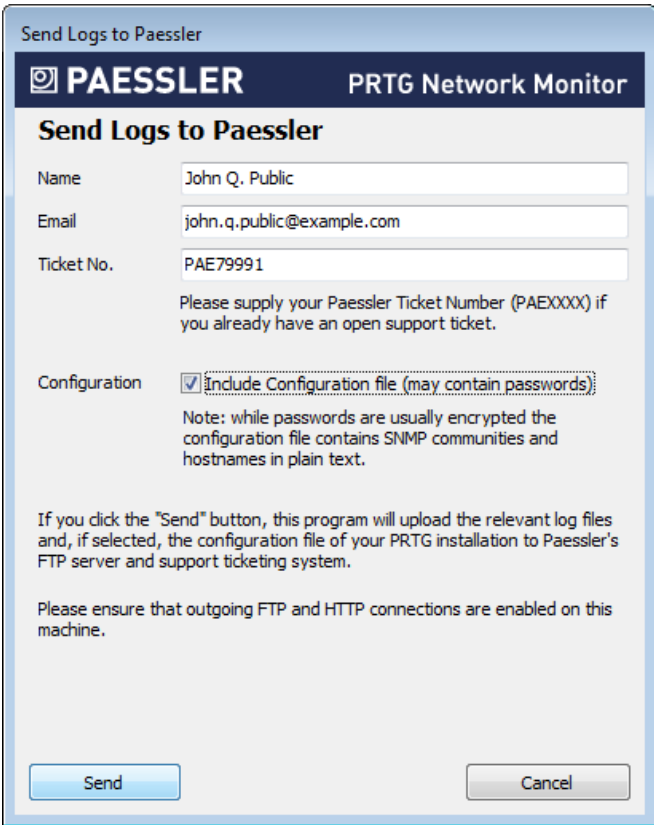

You can view several logs of your PRTG installation. The following buttons are available:

- **View Today's Webserver Log**  
Directly view the content of the web server log for the current date.
- **View Core Server System Log**  
Directly view the content of the core server system log. Depending on the number of entries, it may take a few seconds until the logs are shown.
- **Open Log Folder...**  
Open the log file directory on your hard disk drive to access older web log files, etc.
- **Send Logs to Paessler...**  
Open an assistant to send log files to the Paessler support team. Please see below.

## Logs—Send Logs to Paessler

**Note:** You can send log files more easily with the support bundle via the [Contact Support](#)  form in PRTG's web interface.

Send Logs to Paessler

**PAESSLER** PRTG Network Monitor

### Send Logs to Paessler

Name

Email

Ticket No.

Please supply your Paessler Ticket Number (PAEXXXX) if you already have an open support ticket.

Configuration ☒ Include Configuration file (may contain passwords)

Note: while passwords are usually encrypted the configuration file contains SNMP communities and hostnames in plain text.

If you click the "Send" button, this program will upload the relevant log files and, if selected, the configuration file of your PRTG installation to Paessler's FTP server and support ticketing system.

Please ensure that outgoing FTP and HTTP connections are enabled on this machine.

Send Logs to Paessler

When opening a support ticket, Paessler support may ask you to send log files for further analysis. Using the **Send Logs to Paessler...** button, PRTG will automatically collect, compress and send your log files. **Note:** This button is available when using a commercial license only.

### Name

- Please enter your name.

### Email

- Please enter your valid email address.

### Ticket No.

- This field is optional.
- If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically.
- Please enter the ticket number starting with **PAE** followed by four or more digits.

- If you do not have a ticket number, please leave the field empty. **Note:** You should usually contact the support team **before** sending any files.

### Configuration

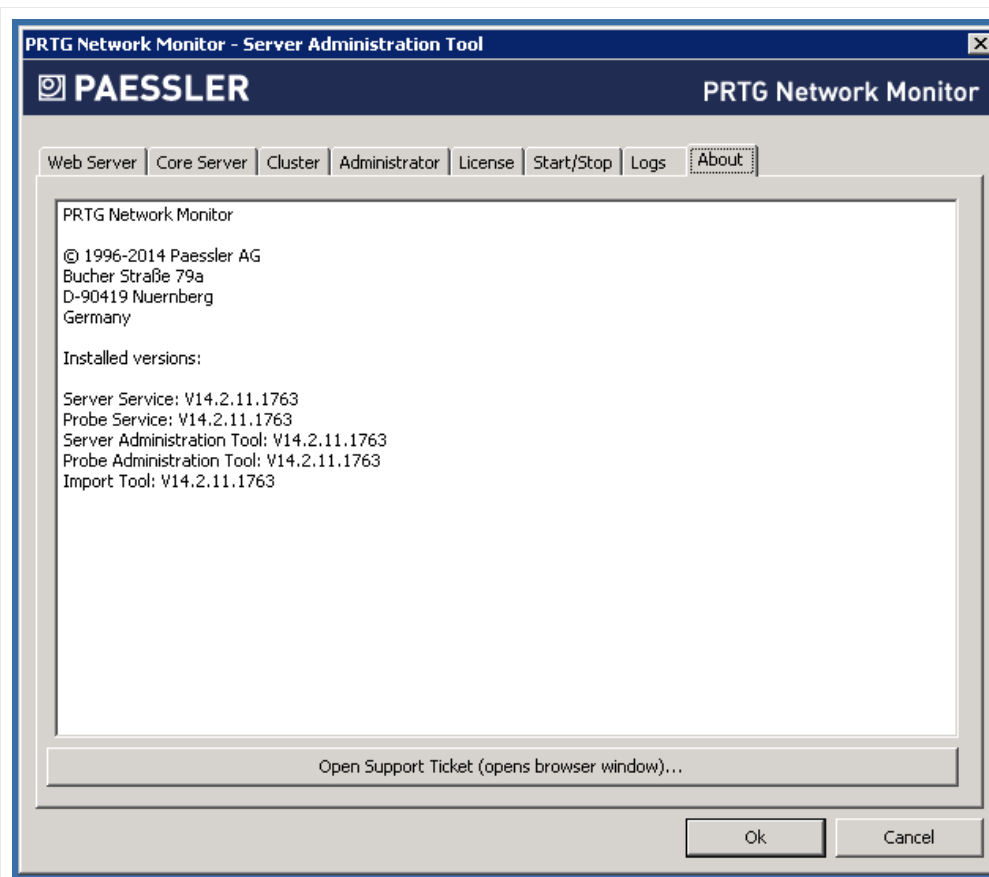

- Define if your configuration file will be included in the data. Passwords are usually encrypted, but there may be some passwords stored as plain text.

### Shortened

- Define if your log files will be shortened (this is the default setting). Sometimes we will ask you to send full log files. In this case, please uncheck this box.

Click on the **Send** button to start data upload. Please make sure FTP and HTTP connections are allowed on this machine.

### About

PRTG Server Administrator

Displays version information for installed PRTG programs. Click on the **Open Support Ticket** button to ask the Paessler support team for help. This will open a new web browser window.

## 11.2 PRTG Probe Administrator

In the PRTG Probe Administrator program, you can define different system related settings that affect your PRTG installation, as well as restart services and define the data storage location.

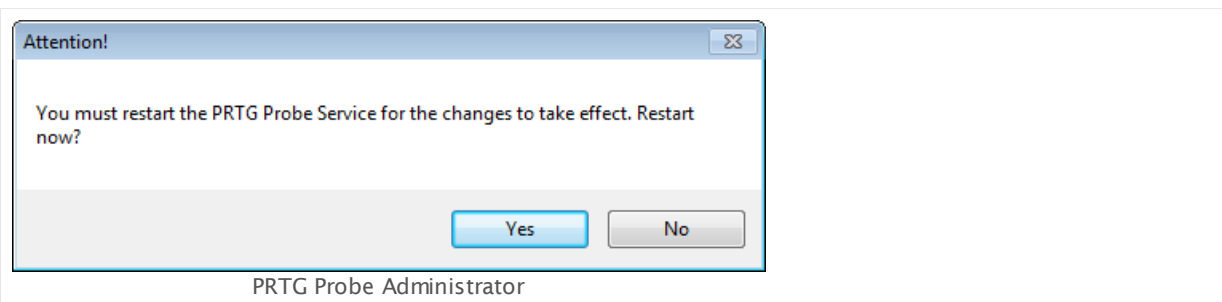

**Note:** To get familiar with the different components of PRTG, we recommend reading the [Architecture](#) <sup>77</sup> section.

**Note:** All settings made here are only valid for the local installation running on the computer you're opening the program on. In order to change settings for another installation, for example, another remote probe installation, please log in to this computer and open the program there.

From the **PRTG Network Monitor** group in Windows start menu, please select **PRTG Probe Administrator** to open the application. You can choose from these options in different tabs:

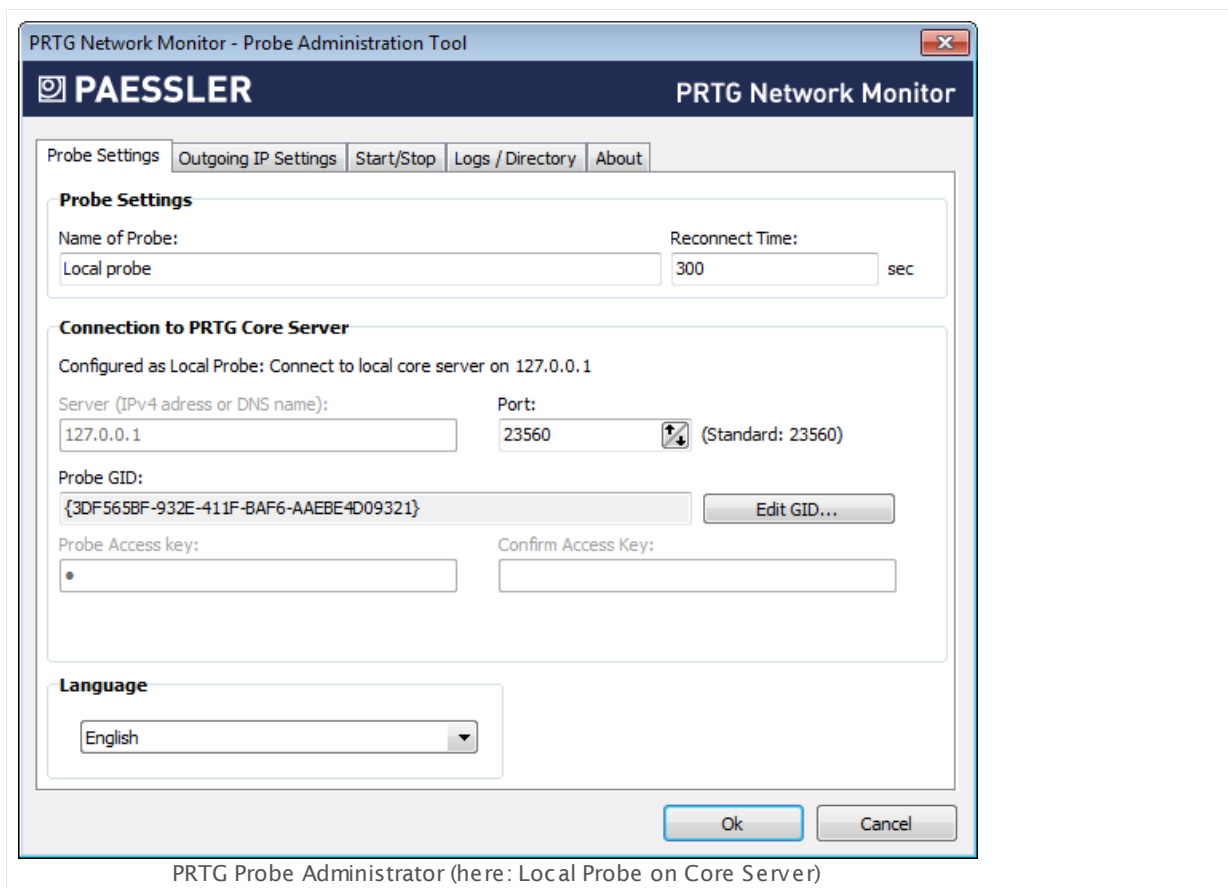

- [Probe Settings](#) <sup>2016</sup>
- [Outgoing IP Settings](#) <sup>2018</sup>
- [Start/Stop](#) <sup>2019</sup>
- [Logs / Directory](#) <sup>2022</sup>
- [About](#) <sup>2024</sup>

When closing the program using the **Ok** button, you are asked to restart the probe Windows service in order to save the settings. Please confirm by clicking the **Yes** button.

### Probe Settings

Define general settings regarding the probe and probe connections.

## Probe Settings—Probe Settings

### Name of Probe

- Enter a name for the probe. It will appear in the device tree in the web interface.

### Reconnect Time

- Define the time that will be waited until the probe tries to reconnect to the core server in case the connection fails.

## Probe Settings—Connection to PRTG Core Server

These settings will affect how the probe will connect to the core server. A probe is either a local probe or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

### When you opened this tool on the PRTG core server

- This probe is configured as the local probe of the PRTG core installation.
- It will connect to the core via **127.0.0.1**.

- Define the **Port** number under which probe and core server will communicate. We recommend using the default value.
- The **Probe GID** is a unique identifier for the probe and should not be changed.
- No access key is needed for local probe connections.

### When you opened this tool on a machine running a Remote Probe

- This probe is configured as remote probe.
- Enter the Server IP address or DNS name and the port for the connection to the core server.
- Define the **Port** number under which probe and core server will communicate. We recommend using the default value.
- The **Probe GID** is a unique identifier for the probe and should not be changed. Except when substituting an existing probe, you must change it to the old probe's GID. To do so, click on the **Edit GID...** button and confirm the warning with **Yes**. You can then change the value.
- The **Probe Access key** must match one of the access keys configured in your PRTG core server installation. If it doesn't, the remote probe will not be able to connect to the core server. Please see [System Administration—Core & Probes](#)<sup>[1849]</sup> (Probe Connection Settings) section for more information. **Note:** Also check the allowed and denied IPs there to make sure the core server accepts the IP address of the remote probe.

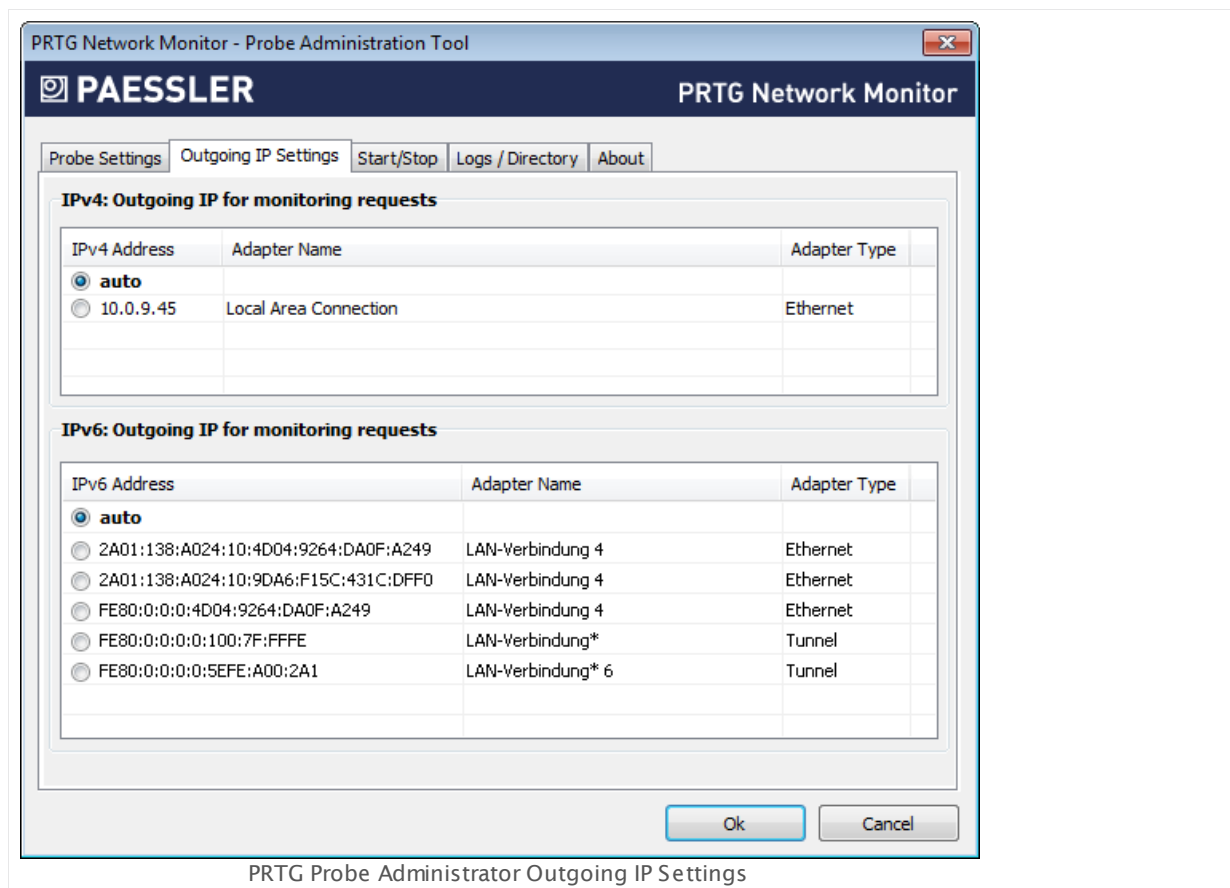

### Probe Settings—Language

- Choose the language for this program from the drop down menu. Default is **English**. Depending on your installation, you may be able to choose other languages here.

### Outgoing IP Settings

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that will be used for outgoing monitoring requests of certain sensor types.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP.
- This is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

## Outgoing IP Settings—IPv4: Outgoing IP for Monitoring Requests

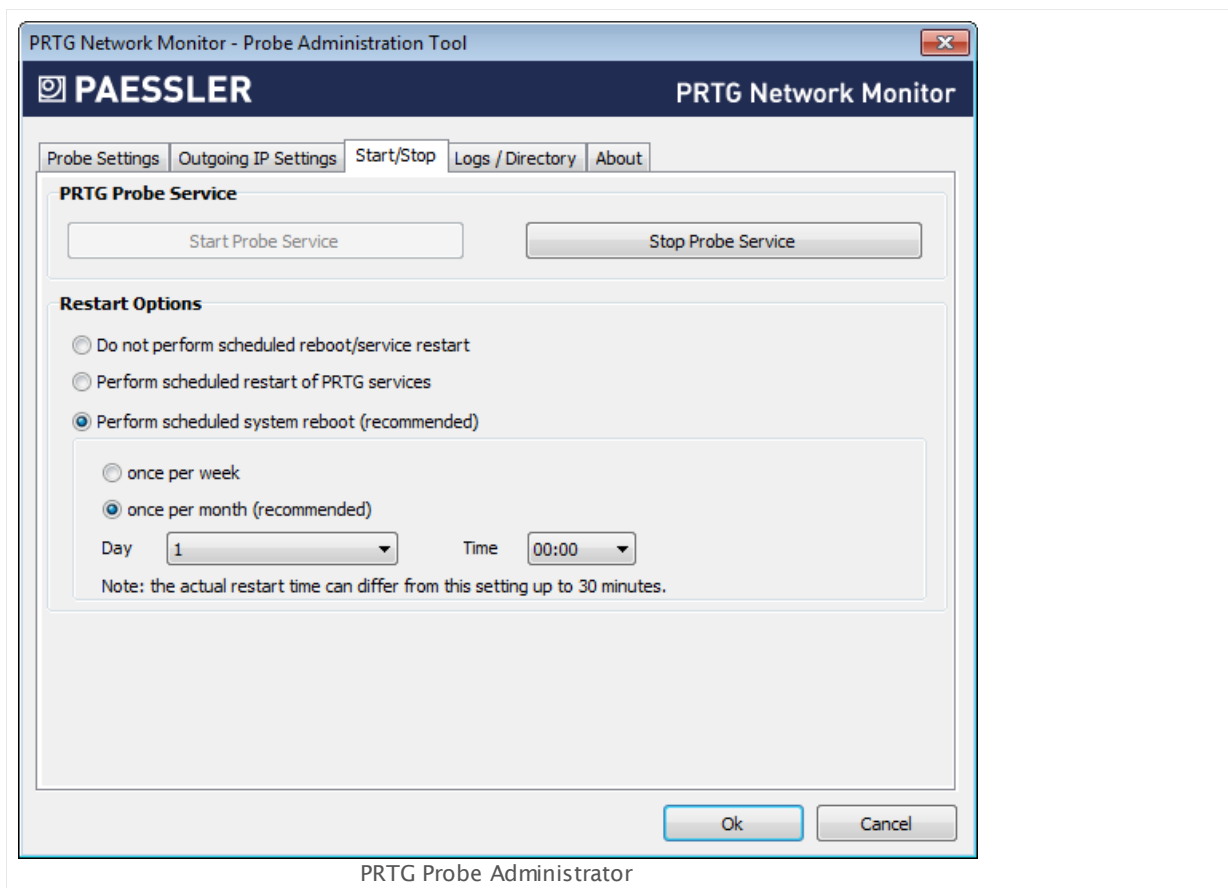

Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.

## Outgoing IP Settings—IPv6: Outgoing IP for Monitoring Requests

Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see [IPv6](#) <sup>97</sup> section.

## Start/Stop

Start or stop the probe Windows service and schedule system restarts.

## Start/Stop—PRTG Probe Service

You can stop and start the probe Windows service manually. Click the **Stop Probe Service** button to stop the service, and **Start Probe Service** to start it again. Both actions usually take from a few seconds up to several minutes to complete.

## Start/Stop—Restart Options

For best performance we recommend to restart the Windows servers PRTG is running on from time to time. In order for PRTG to do this automatically you can schedule an automatic reboot. There are the following options:

### Do not perform scheduled reboot/service restart

- Do not perform any scheduled reboot or restart of services automatically.
- We recommend a manual restart every few weeks.

### Perform scheduled restart of PRTG services

- Restart both core server and probe service.

- Please enter a schedule below.

#### **Perform scheduled system reboot (recommended)**

- This is the recommended setting, although not set by default.
- Please enter a schedule below.
- We recommend restarting Windows servers once a month for best performance.

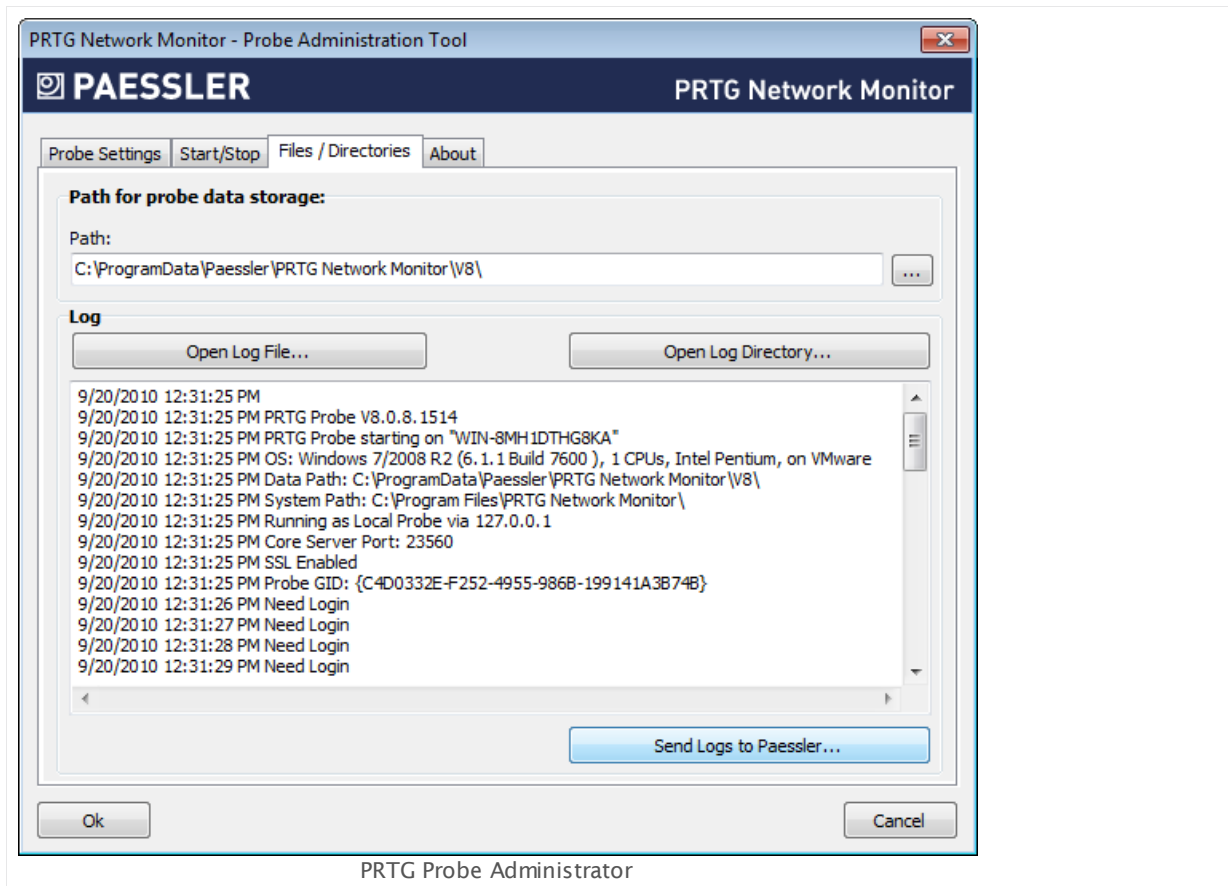

#### **[Schedule]**

When scheduling an automatic service restart or reboot, define a schedule. The options are:

- **Once per Week:** Select a weekday and time below.
- **Once per Month:** Select a day of month and time below. When selecting **Last**, the report will always run on the last day of the month, regardless of how many days the month has. When selecting a date that does not exist in every month, e.g. the 30th in May, PRTG will automatically run the report on the last day of this month.

**Note:** A Windows warning message will be displayed 10 minutes before reboot to inform a logged in user. The actual restart time can differ up to 30 minutes from the settings entered here!

## Logs / Directory

### Path for probe data storage

- **Note:** This setting is relevant merely for probe only installations, for example, when running a remote probe on the system. For an installation of PRTG core server and probe, i.e. a full PRTG installation, the path setting in this window is overridden by the path defined in the settings of [PRTG Server Administrator](#) <sup>2002</sup>.
- Define the data folder to which PRTG will store configuration and monitoring data. **Note:** Before changing the path, make sure you stop both services and copy all data to the new location.

### Log

You can view the log of your PRTG probe. The following buttons are available:

- **Open Log File...**  
Directly view the content of the probe system log. Depending on the number of entries, it may take a few seconds until the logs are shown.

- **Open Log Directory...**  
Open the log file directory on your hard disk drive.
- **Send Logs to Paessler...**  
Open an assistant to send log files to the Paessler support team. Please see below.

## Logs / Directory—Send Logs to Paessler

Send Logs to Paessler

**PAESSLER** PRTG Network Monitor

**Send Logs to Paessler**

Name

Email

Ticket No.

Please supply your Paessler Ticket Number (PAEXXXX) if you already have an open support ticket.

Configuration ☒ Include Configuration file (may contain passwords)

Note: while passwords are usually encrypted the configuration file contains SNMP communities and hostnames in plain text.

If you click the "Send" button, this program will upload the relevant log files and, if selected, the configuration file of your PRTG installation to Paessler's FTP server and support ticketing system.

Please ensure that outgoing FTP and HTTP connections are enabled on this machine.

Send Logs to Paessler

When opening a support ticket, Paessler support may ask you to send log files for further analysis. Using the **Send Logs to Paessler...** button, PRTG will automatically collect, compress and send your log files. **Note:** This button is available when using a commercial license only.

### Name

- Please enter your name.

### Email

- Please enter your valid email address.

### Ticket No.

- This field is optional.

- If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically.
- Please enter the ticket number starting with **PAE** followed by four or more digits.
- If you do not have a ticket number, please leave the field empty. **Note:** You should usually contact the support team **before** sending any files.

### Configuration

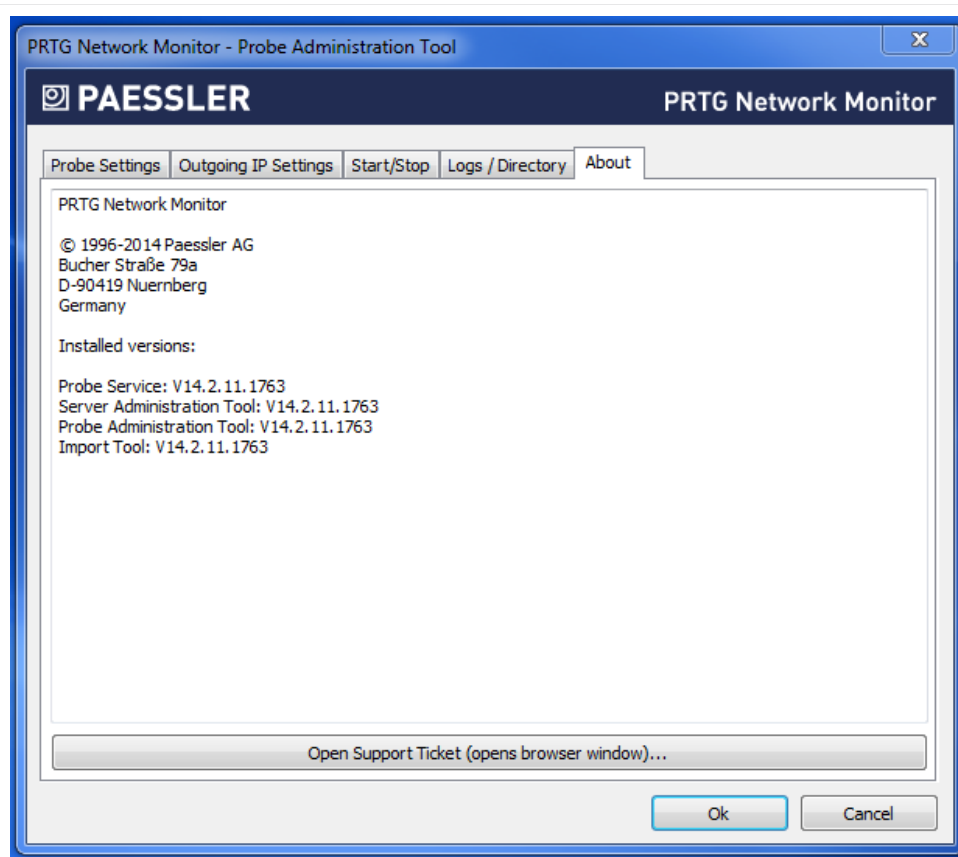

- Define if your configuration file will be included in the data. Passwords are usually encrypted, but there may be some passwords stored as plain text.

### Shortened

- Define if your log files will be shortened (this is the default setting). Sometimes we will ask you to send full log files. In this case, please uncheck this box.

Click on the **Send** button to start data upload. Please make sure FTP and HTTP connections are allowed on this machine.

### About

PRTG Probe Administrator

Displays version information for installed PRTG programs. Click on the **Open Support Ticket** button to ask the Paessler support team for help. This will open a new web browser window.

# Part 12

## Advanced Topics

# 12 Advanced Topics

In this section topics are covered that address more advanced PRTG users. If you already gained some experience with PRTG, you might want to learn more about the topics following.

## Advanced Topics

- [Active Directory Integration](#)  2029
- [Application Programming Interface \(API\) Definition](#)  2031
- [Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors](#)  2032
- [Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors](#)  2036
- [Define IP Ranges](#)  2038
- [Define Lookups](#)  2039
- [Regular Expressions](#)  2048
- [Add Remote Probe](#)  2049
- [Failover Cluster Configuration](#)  2064
- [Data Storage](#)  2074
- [Using Your Own SSL Certificate](#)  2076
- [Calculating Percentiles](#)  2078

## 12.1 Active Directory Integration

PRTG offers a detailed rights management via different user groups. For detailed information please see [User Access Rights](#)<sup>[94]</sup>.

In order to make user management easier, you can integrate an existing Active Directory into PRTG in four steps. During this process, you will connect an Active Directory (AD) group with a user group in PRTG. All members of your AD group will then be able to log into PRTG using their AD domain credentials. **Note:** You cannot add single AD users to PRTG, but only allow access for entire groups. A PRTG user will be created automatically for each AD user who logs in to PRTG successfully.

### Step 1: Prepare Your Active Directory

- In your Active Directory, please make sure that users you want to give access to PRTG are member of the same AD group.
- You can also organize users in different groups, for example, one group whose members will have administrator rights within PRTG, and another one whose members will have read-only rights within PRTG.

### Step 2: Prepare Your PRTG Server

- Make sure that the computer running PRTG is member of the domain you want to integrate it to. You can check this setting in your machine's **System Properties** (for example, **Control Panel | System and Security | System**, click on **Change settings** link).

### Step 3: Add Domain and Credentials (optional) to System Settings

- In the PRTG [web interface](#)<sup>[100]</sup>, switch to the [System Administration—Core & Probes](#)<sup>[1852]</sup> settings.
- In the **Active Directory Domain** field, enter the name of your local domain. **Note:** You can only integrate one AD domain into PRTG.
- **Optional:** PRTG will use the same Windows user account used to run the "PRTG Core Server Service". By default, this is the "local system" Windows user account. If this user does not have sufficient rights to query a list of all existing groups from the Active Directory, you should provide credentials of a user account with full AD access by using the **Use explicit credentials** option.
- **Save** your settings.

### Step 4: Add a New User Group

- Switch to the **User Groups** tab (see [System Administration—User Groups](#)<sup>[1861]</sup>).
- Click on the **Add User Group** button to add a new PRTG user group.
- In the dialog appearing, enter a meaningful name and set the **Use Active Directory** setting to **Yes**.

- From the **Active Directory Group** drop down menu, select the group of your Active Directory whose members will have access to PRTG. If you have a very large Active Directory, you will see an input field instead of a drop down. In this case, you can enter the group name only; PRTG will add the prefix automatically.
- With the **New User Type** setting, define the rights a user from the selected Active Directory group will have when logging in to PRTG for the first time. You can choose between **Read/Write User** or **Read Only User** (latter is useful to show data only to a large group of users).
- **Save** your settings.

## Done

That's it. All users in this Active Directory group can now log in to PRTG using their AD domain credentials. Their user accounts will use the PRTG security context of the PRTG user group you just created.

## Notes and Limitations

- Active Directory users can [log in to the web interface](#)<sup>[102]</sup> using their Windows username and password (please do not enter any domain information in PRTG's **Login Name** field). When such a user logs in, PRTG will automatically create a corresponding local account on the PRTG core server. Credentials are synchronized every hour.
- All requests to the Active Directory servers are cached for one hour, for performance reasons. If a password is changed in the Active Directory, you must either wait for 1 hour or clear the cache manually by clicking on the **Clear Caches** button on the [System Administration—Administrative Tools](#)<sup>[1865]</sup> page in the [Setup](#)<sup>[1810]</sup> menu).
- By default, there aren't any rights set for the new PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree. Please edit your device tree [object's settings](#)<sup>[142]</sup> and set access rights for your newly created user group in the **Inherit Access Rights** section. **Note:** The easiest way is to set these rights in the [Root Group Settings](#)<sup>[224]</sup>.
- PRTG only supports explicit group rights. If your AD uses groups which are member of another group, PRTG will **not** regard inherited implicit rights of the parent group and therefore refuse login for members of those groups.
- PRTG will ignore AD information about Organizational Units (OUs). These values cannot be read by PRTG.
- PRTG does not support SSO (single sign-on).

## 12.2 Application Programming Interface (API) Definition

The PRTG Application Programming Interface (API) enables you to access monitoring data and manipulate objects using HTTP requests, run your own written sensors and notifications, implement Mini Probes, and customize the web interface.

### Detailed HTTP API Documentation

An interactive documentation of the API is integrated into your PRTG installation: [Login to the web interface](#)<sup>102</sup> and select **Set up | PRTG API** from the main menu.

In different tabs, the documentation provides information about:

- **HTTP API:** Access monitoring data and manipulate monitoring objects using HTTP requests (includes an interactive query builder)
- **Custom Sensors:** Create your own sensors for customized monitoring
- **Custom Notifications:** Create your own notifications to send alarms to external systems
- **Mini Probe API:** Create your own small probes to get monitoring data from any platform
- **Website Styling:** Customize the look and feel by adding your own CSS statements

You can also have a look at Paessler's PRTG demo installation's API documentation. But only the documentation that comes with your PRTG installation fits exactly the PRTG version you are using.

### More

API Documentation in Paessler's PRTG Demo Installation

- <http://prtg.paessler.com/api.htm?username=demo&password=demodemo>

## 12.3 Filter Rules for xFlow, IPFIX and Packet Sniffer Sensors

Filter rules are used for the include, exclude, and channel definition fields of Packet Sniffer, xFlow, and IPFIX sensors. They are based on the following format:

```
field[filter]
```

### Valid Fields for All Sensors

- **IP**  
Possible values: IP address or DNS name (see [Valid Data Formats](#) 2032 below)
- **Port**  
any number
- **SourceIP**  
Possible values: IP address or DNS name (see [Valid Data Formats](#) 2032 below)
- **SourcePort**  
any number
- **DestinationIP**  
Possible values: IP address or DNS name (see [Valid Data Formats](#) 2032 below)
- **DestinationPort**  
any number
- **Protocol**  
Possible Protocol values: **TCP**, **UDP**, **ICMP**, **OSPF**, **IGMP**, or any number
- **TOS**  
Type Of Service (any number)
- **DSCP**  
Differentiated Services Code Point (any number)

### Additional Fields for Packet Sniffer Sensors Only

- **MAC**  
physical address (see [Examples](#) 2032 below)
- **SourceMAC**  
physical address
- **DestinationMAC**  
physical address
- **EtherType**  
Possible EtherType values: **IPv4**, **ARP**, **RARP**, **APPLE**, **AARP**, **IPv6**, **IPX**, **IPXold**, **IPX**, or any number
- **VlanPCP**  
IEEE 802.1Q VLAN Priority Code Point

- **VlanID**  
IEEE 802.1Q VLAN Identifier
- **TrafficClass**  
IPv6 Traffic Class (corresponds to TOS used with IPv4)
- **FlowLabel**  
IPv6 Flow Label

### Additional Fields for NetFlow v5 and jFlow v5 Sensors Only

- **Interface**  
any number
- **ASI**  
any number
- **InboundInterface**  
any number
- **OutboundInterface**  
any number
- **SenderIP**  
IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see [Valid Data Formats](#) 2035 below)
- **SourceASI**  
any number
- **DestinationASI**  
any number

### Additional Fields for NetFlow v9 and IPFIX Sensors Only

- **Interface**  
any number
- **ASI**  
any number
- **InboundInterface**  
any number
- **OutboundInterface**  
any number
- **SenderIP**  
IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see [Valid Data Formats](#) 2035 below)
- **SourceASI**  
any number

- **DestinationASI**  
any number
- **MAC**  
physical address
- **SourceMAC**  
physical address
- **DestinationMAC**  
physical address
- **Mask**  
"Mask" values represent subnet masks in the form of a single number (number of contiguous bits).
- **DestinationMask**  
"Mask" values represent subnet masks in the form of a single number (number of contiguous bits).
- **Next Hop (IP address)**  
Possible values: IP address or DNS name (see [Valid Data Formats](#)  below)
- **VLAN**  
"VLAN" values represent a VLAN identifier (any number).
- **SourceVLAN**  
"VLAN" values represent a VLAN identifier (any number).
- **DestinationVLAN**  
"VLAN" values represent a VLAN identifier (any number).

### Additional Fields for sFlow Sensors Only

- **Interface**  
any number
- **InboundInterface**  
any number
- **OutboundInterface**  
any number
- **SenderIP**  
IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see [Valid Data Formats](#)  below)
- **MAC**  
physical address
- **SourceMAC**  
physical address
- **DestinationMAC**  
physical address

## Valid Data Formats

- IP fields support wildcards (\*), range (10-20) and hostmask ( /10, /255.255.0.0) syntax, as well as DNS names.
- Number fields support range (80-88) syntax.
- Protocol and EtherType fields support numbers and a list of predefined constants.

For detailed information on IP ranges, please see [Define IP Ranges](#)  section.

## Examples

All of the following filter rules are valid examples:

```
SourceIP[10.0.0.1]
SourceIP[10.*.*.*]
SourceIP[10.0.0.0/10]
DestinationIP[10.0.0.120-130]
DestinationPort[80-88]
Protocol[UDP]
MAC[00-60-50-X0-00-01]
DSCP[46]
```

Complex expressions can be created using parentheses ( ) and the words **and**, **or**, or **and not**. For example, this is a valid filter rule:

```
Protocol[TCP] and not (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

## Related Topics

- [Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors](#)

- [Monitoring Bandwidth via Flows](#) 

Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- <http://kb.paessler.com/en/topic/60203>

## 12.4 Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors

When adding Custom xFlow sensors, Custom IPFIX, or Custom Packet Sniffing sensors, you will notice a field entitled **Channel Definition**. In this field you need to provide the channel definitions in the following syntax (one entry per channel):

```
#<id>:<Name>  
<Rule>
```

### Syntax

- **<id>** needs to be 1 or greater and must be unique for the sensor (i.e., each channel definition must have a unique ID). **Note:** The maximum channel ID you can use is 2147483648 (2<sup>31</sup>). Higher IDs are not supported. We recommend using channel IDs 1, 2, 3, etc.
- The **<id>** is linked to the historic data: As soon as it has been changed, the history for this particular channel is lost.
- One rule can span multiple lines.
- The next rule starts with a # as first character in a line.
- **<name>** is the channel's display name.
- The rules are processed top to bottom (the number doesn't matter) and the data is accounted to the first match.
- One **Other** channel is added automatically.
- Behind the name a optional [**<unit>**] can be used to override the automatic unit based on the source sensors.

The **<Rule>** syntax is identical to the one described in the [Filter Rules for xFlow and Packet Sniffer Sensors](#) section. Since data is accounted to the first match, please make sure to start with the most specific rule at the top getting less specific to the bottom.

**Note:** We recommend writing the rule list in an external editor and paste it into the respective PRTG field. Otherwise, if the rules contain an error, the entries will be removed when adding the rules in case!

### Example

General example:

```
#5:HTTP  
Protocol[TCP] and  
(SourcePort[80] or DestinationPort[80] or SourcePort[8080] or  
DestinationPort[8080])
```

Channel definition example for differentiating by protocol:

```
#1:TCP
Protocol[TCP]

#2:UDP
Protocol[UDP]

#3:ICMP
Protocol[ICMP]
```

- <http://kb.paessler.com/en/topic/2143>

## 12.5 Define IP Ranges

In some setting fields, you can either enter a host name or single IP address, or you can define IP ranges. PRTG follows a common syntax for this. IP ranges are available, for example, for [xFlow and Packet Sniffer sensors](#)<sup>[291]</sup>, and for [probes settings](#)<sup>[1849]</sup>.

**Note:** For the syntax available for PRTG's automatic network discovery, please see [Auto-Discovery](#)<sup>[192]</sup> (**IP Selection Method** setting).

### Available Options

Option	Description	Syntax	Example(s)
Simple	Enter a fixed IP address.	a.b.c.d	10.0.10.9
Hostname	Enter a hostname. PRTG will resolve it to an IP address in your network.	hostname	device-xyz
Hostmask	Enter a hostmask. A hostmask defines the relevant bits of the IP address.	a.b.c.d/h <b>or</b> a.b.c.d/e.f.g.h	10.0.0.0/255
Range	Enter an IP address range. Please replace each of <b>a</b> , <b>b</b> , <b>c</b> , <b>d</b> by either <ul style="list-style-type: none"> <li>* (asterisk) for any value; corresponds to <b>0-255</b></li> <li>—or—</li> <li><b>x-y</b> for any range between <b>0</b> and <b>255</b>.</li> </ul>	a.b.c.d	10.0.0.1-20 <b>or</b> 10.*.0.* <b>or</b> 10.0.0-50.*

## 12.6 Define Lookups

PRTG uses **lookups** for some sensor types with custom channels. In general, lookups map status values as returned by a device (usually integers) to more informative expressions that show you the status of a monitored device as a clear message. Additionally, lookups can define the [sensor status](#) <sup>[121]</sup> that will be shown for certain status codes (similar as [sensor channel limits](#) <sup>[1710]</sup> can define a sensor status, too). For example, for a printer, PRTG can show a sensor in a yellow [Warning](#) <sup>[121]</sup> status with channel values like "Toner Low" instead of simple status codes.

Lookups can be customized individually; you can define your own texts that will be shown in a sensor's channel. See section [Customizing Lookups](#) <sup>[2044]</sup> below.

**Note:** If a channel uses lookups, we strongly recommend you to control the sensor status only via the lookup definition and not to use channel limits! See also section [Sensor Channels Settings](#) <sup>[1710]</sup>.

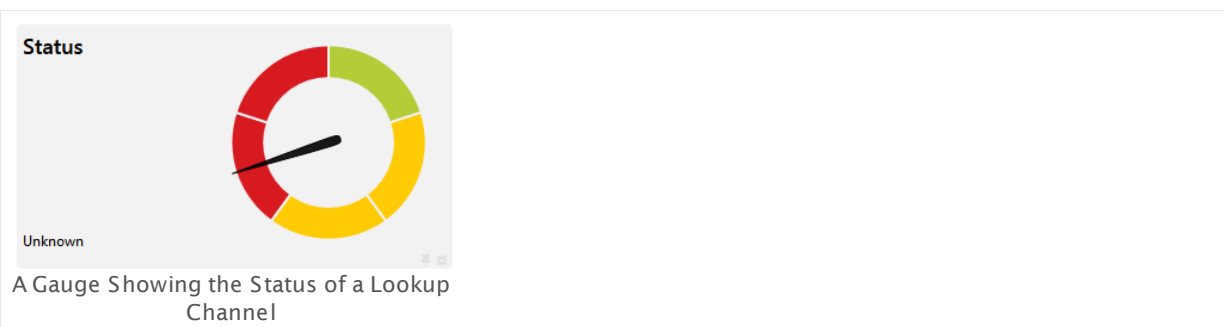

**Note:** Lookups do not change data in PRTG's database, but they merely change the way sensor channels are shown. Any change to lookup definition files will apply to historic data as well as to live data.

### Requirement: Channel Unit "Custom"

All channels with enabled **Value Lookup** need to use the channel Unit "**Custom**". For details, refer to section [Sensor Channels Settings](#) <sup>[1710]</sup>.

### Gauges of Lookup Channels

PRTG can display gauges for channels which use lookups. We recommend staying below 120 lookup values in order to display informative gauges for primary channels. Non-primary channels have an upper limit of around 40 lookup values.

## Lookups Directory and Format

Lookups are defined in XML format in files ending in **.ovl**. PRTG's standard lookup files are located in the [PRTG program directory](#)<sup>[2074]</sup> in a sub folder named **lookups**. These files are maintained by PRTG itself. In each of the files lookups are defined for one or more sensors. Furthermore, the lookups folder contains a sub folder named **custom** to store your customized lookups.

The files follow a basic principle. For each numeric value you can define:

- A message that will be looked up and shown instead of the value
- The status the sensor will show

## Example

The following code illustrates the lookup definition for the toner status of the [SNMP HP LaserJet Hardware](#)<sup>[1036]</sup> sensor:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <Lookups>
    <SingleInt state="Ok" value="0">
      Toner Okay
    </SingleInt>
    <SingleInt state="Warning" value="1">
      Toner Low
    </SingleInt>
    <SingleInt state="Error" value="2">
      No Toner Cartridge Loaded
    </SingleInt>
  </Lookups>
</ValueLookup>
```

The schema in the example provides an insight how lookups are defined:

- The **<?xml>** tag in the first line defines the content as XML.
- The **<ValueLookup>** tag in the second line contains:
  - The **ID** which will be shown in the [Sensor Channels Settings](#)<sup>[1709]</sup>.
  - The **desiredValue**<sup>[2045]</sup> attribute contains the value which will be used for the calculation of the "Coverage". In this example, 1 is defined.
  - The **xsi** attributes refer to PRTG's predefined XML schema definitions (which allow easy editing of lookup files with supported editors). We recommend using the default value.

- Between the tags **<Lookups>** and **</Lookups>** the particular lookups for the sensor data are defined:
  - A lookup entry starts with a tag containing the type of the status value, the **lookup type** (in this example, this is always **<SingleInt>**).
  - Separated by whitespace, the **state** attribute defines the status the sensor will show. Allowed values are: **Ok**, **Warning**, **Error**, and **None** ("None" will not trigger a status change).
  - The **value** attribute defines which numeric value will trigger the lookup. This is the value that PRTG will receive from the device.
  - The **text** defines the substitution text that will be shown instead of the value. For example, this can be a status message.
- The same way all other possible lookups are defined. The lookup definitions are closed by the tag **</Lookups>**. The file closes with **</ValueLookup>**.

In our example, the lookup file will have the following effect:

Value as Reported from HP Printer	Value Shown in PRTG (Sensor Channel)	Sensor Status Shown by PRTG
0	Toner Okay	Up
1	Toner Low	Warning
2	No Toner Cartridge Loaded	Down

## The XML Schema

An overall schema of the XML files containing the lookups definitions can be sketched like this:

## Part 12: Advanced Topics | 6 Define Lookups

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="..." desiredValue="..." xmlns="..." xsi="...">
  <Lookups>
    <SingleInt state="..." value="...">
      status text
    </SingleInt>
    <BitField state="..." value="...">
      status text
    </BitField>
    <Range state="..." from="..." to="...">
      status text
    </Range>

    [several other lookup definitions]

  </Lookups>
</ValueLookup>
```

Element	Description	Attributes, Value Assignment, and Content
<code>&lt;?xml&gt;</code> <code>content</code>	This is the XML declaration. Every XML file begins with it.	<ul style="list-style-type: none"> <li>▪ <b>version</b> and <b>encoding</b> are "1.0" resp. "UTF-8"</li> <li>▪ <b>content</b>: <code>&lt;ValueLookup&gt;contentValueLookup&lt;/ValueLookup&gt;</code></li> </ul>
<code>&lt;ValueLookup&gt;</code> <code>contentValueLookup</code> <code>&lt;/ValueLookup&gt;</code>	Defines the ID of the channel, what desiredValue is used, and links to PRTG's predefined schema definitions, which allow easy editing of lookup files with supported editors.	<ul style="list-style-type: none"> <li>▪ <b>id</b>: specifies how the name of the lookup file is shown in the <a href="#">Sensor Channels Settings</a> <sup>1709</sup></li> <li>▪ <b>desiredValue</b> <sup>2043</sup>: please see below</li> <li>▪ <b>xmlns:xsi/xsi</b>: refers to predefined XML schema definition</li> <li>▪ <b>contentValueLookup</b>: lookup definitions <code>&lt;Lookups&gt;contentLookups&lt;/Lookups&gt;</code></li> </ul>
<code>&lt;Lookups&gt;</code> <code>contentLookups</code> <code>&lt;/Lookups&gt;</code>	Defines the particular lookups for the sensor data.	<ul style="list-style-type: none"> <li>▪ <b>contentLookups</b>: one or more lookup entries, see below</li> </ul>
<code>&lt;SingleInt&gt;</code> <code>status text</code> <code>&lt;/SingleInt&gt;</code>  <code>&lt;BitField&gt;</code> <code>status text</code> <code>&lt;/BitField&gt;</code>  <code>&lt;Range&gt;</code> <code>status text</code> <code>&lt;/Range&gt;</code>	Each element defines one lookup entry. There can be one or more entries in this format. <b>SingleInt</b> , <b>BitField</b> , and <b>Range</b> are <a href="#">lookup types</a> <sup>2043</sup> .	<ul style="list-style-type: none"> <li>▪ <b>state</b>: defines the state the sensor will show; allowed values: <b>Ok</b>, <b>Warning</b>, <b>Error</b>, <b>None</b></li> <li>▪ <b>value</b>: defines the value which triggers the lookup. Please enter an integer value. <b>Note</b>: <b>Range</b> needs always both values "from" and "to".</li> <li>▪ <b>status text</b>: defines a <b>status text</b> that will be used as substitution text and shown instead the integer value. For example, a status message.</li> </ul>

Since all the XML files containing lookup definitions are delivered in a pre-given schema as indicated above, it will be easy and comprehensible for you to customize lookups.

## Customizing Lookups

There is a subfolder named `\lookups\custom` located in the [PRTG program directory](#)<sup>2074</sup>. In order to customize existing lookups, copy the desired lookup file from the `lookups` folder to the `custom` folder or create a new `.ovl` file there. When using the same ID in the **ValueLookup** tag, the files in the `\lookups\custom` folder will have a higher priority than the original files in the `lookups` folder. This way, your customizations will be handled preferably by PRTG instead of the original lookup settings. If you want to use custom lookup definitions **in addition** to the existing lookups, define a new ID in the lookup file which is not used by another lookup file. PRTG identifies lookup definitions via this ID, it does **not** use the file name.

Open the file with an XML or text editor and adjust the lookups to your personal preferences. You can define your own messages as well as you can customize sensor states for the particular return values. For example, if you do not want an "Error" status (i.e. a sensor **Down** status) for the return value "2" but only a warning, then you can replace "Error" with "Warning".

**Note:** The possible states are given in the `LookupState.xsd` file in the custom directory. Following the schema of the XML files that are delivered with PRTG enables you to edit the lookups in a safe way.

### Example for Lookups Customization

For example (just for illustration purposes), imagine you would like to add the status "None" to the [example](#)<sup>2040</sup> above and change the status for the return value "2" from "Down" to "Warning". Then do the following:

- Copy the file `oid.paessler.hplaserjet.tonerstatus` to the `\lookups\custom` subfolder of your PRTG installation.
- Open this file with an editor.
- Leave the ID value unchanged to prioritize the customized lookup to the original file.
- Replace "Error" with "Warning" for value "2".
- Add a "SingleInt" element with status "None" for the (hypothetical) return value "3".
- Save the file and [reload](#)<sup>2046</sup> the custom lookup folder in PRTG.

The customized lookup file will finally look like this:

```

<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <Lookups>
    <SingleInt state="Ok" value="0">
      Toner Okay
    </SingleInt>
    <SingleInt state="Warning" value="1">
      Toner Low
    </SingleInt>
    <SingleInt state="Warning" value="2">
      No Toner Cartridge Loaded
    </SingleInt>
    <SingleInt state="None" value="3">
      Unknown status of toner
    </SingleInt>
  </Lookups>
</ValueLookup>

```

## desiredValue Attribute

It is necessary to define a **desiredValue** in the lookup files. The **desiredValue** corresponds to a status value triggering a lookup. PRTG calculates the percentage of time this specific state has been monitored. The result is displayed for all data tables and graphs that show averaged values.

Considering the example above where the **desiredValue** is "1", PRTG will calculate the percentage of time the toner status has been "Warning". If in a time span of five minutes four of five sensor scans returned a "Warning" status, PRTG would show an average of 80% for this time span, because in 80% of the time the sensor showed a "Warning".

## Lookup Types: SingleInt, BitField, Range

Beside the lookup type **SingleInt** as seen above, there are two other lookup types: **BitField** and **Range**. Using these types you can define lookup values beyond simple integers.

Lookup Type	Description	Syntax
SingleInt	Uses an <b>integer</b> to define a lookup for one status value.	value="int"
BitField	Uses a <b>bit field</b> for multiple status values.	Should only be used if you have basic knowledge about bitmasks. Please see <a href="#">More</a> below for a general introduction. <b>Note:</b> Every value has to equal a power of two (e.g., 1, 2, 4, 8, 16, 32, 64, etc.).
Range	Uses an inter range <b>from-to</b> to define a lookup for several status values.	from="int" to="int" <b>Note:</b> Using ranges, the parameters "from" and "to" always have to be defined. If you want to query only one single value in a range file, this value must be set as parameter for "from" <b>and</b> "to" (e.g., from="2" to="2").

**Note:** You can use only one kind of lookup type in one lookup file. For example, only **SingleInts**, **BitField**, or **Ranges**. Different lookup types in one file are not allowed.

## Define Lookup Files in Sensor Channel Settings

For each sensor with a custom channel you can define a lookup file that will be used. This is done in a sensor's channel settings with an option called "Value Lookup". This option is visible for many **SNMP sensors**, some **application sensors**, and always for the following sensor types:

- [EXE/Script Sensor](#) <sup>431</sup>
- [EXE/Script Advanced Sensor](#) <sup>440</sup> (if a **Custom** unit is defined)
- [SNMP Custom Sensor](#) <sup>987</sup>

For details, please see the [Sensor Channel Settings](#) <sup>1709</sup> section.

## Loading Lookups

You can (re)load the defined lookups in the custom folder by clicking the **Load Lookups** button. This button can be found in PRTG under **Set up | System Administration | Administrative Tools** <sup>1865</sup>.

### Debugging—What will happen if...?

- A return value is defined in the lookups that never will be returned by a device because the value is not assigned: The value will never be triggered, so PRTG will simply ignore this entry.
- PRTG receives a return value that is not defined for lookups: No substitution message can be found. PRTG will just show the return value.
- Different lookup types are in one lookup file: This is not allowed and PRTG will discard this lookup definition. If you use miscellaneous lookup types in one file, for example, ranges and singleInts together, the PRTG system will create a ticket when loading lookups or restarting the PRTG server with the following error message: **Value lookup file "[...]" could not be loaded (" " is not a valid integer value)**.
- Incorrect XML code: PRTG will create a new ticket when loading lookups or restarting the PRTG server with a corresponding error message and discard this lookups definition.

Wikipedia: Masks (computing)

- [http://en.wikipedia.org/wiki/Bit\\_mask](http://en.wikipedia.org/wiki/Bit_mask)

## 12.7 Regular Expressions

For some sensors, you can use regular expressions to match a search pattern. PRTG will use PCRE-RegExp. In the following, we will provide examples for the most common patterns.

### Common Search Patterns

Find matches containing the word **error** or **alarm**:

```
\b(error|alarm)\b
```

Find matches containing the words **error** and **alarm** in any order:

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

Find matches containing all of the words **t**ree, **f**lower, **l**eam, and **b**ug, in any order:

```
(?=.*\btree\b)(?=.*\bflower\b)(?=.*\bleaf\b)(?=.*\bbug\b).*
```

### Example

The search pattern

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

will match the following expressions:

- alarm error
- error alarm
- I am an error and I evoke an alarm
- I am an alarm and I indicate an error
- An alarm combined with an error indeed!
- An error combined with an alarm, too!

## 12.8 Add Remote Probe

To monitor different sub-networks that are separated by a firewall, to keep an eye on remote locations, or for several other scenarios, you can extend your monitoring by installing one or more **Remote Probes**.

### Extend Your Monitoring Now

Installing remote probes is easy and done in a few minutes. Please see the sections linked below for further instructions.

- Background: [Remote Probes and Multiple Probes](#) 2050
- Installing: [Remote Probe Quick Install](#) 2053
- Step by Step: [Remote Probe Set up](#) 2059

### More

Video Tutorial: Core Server and Remote Probes

- [http://www.paessler.com/support/video\\_tutorials/distributed\\_monitoring](http://www.paessler.com/support/video_tutorials/distributed_monitoring)

### 12.8.1 Remote Probes and Multiple Probes

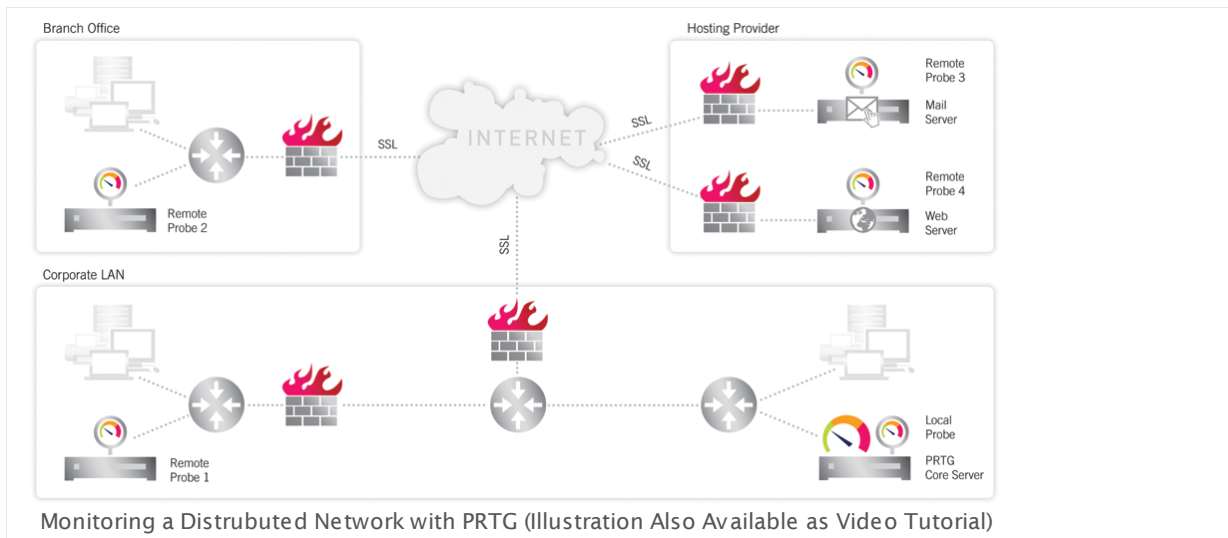

Upon installation, PRTG creates the first probe automatically, called the **Local Probe**. It runs on the same machine as the PRTG core server and monitors all devices from this system, using the sensors you have configured. Working with only one local probe should suffice for Local Area Network (LAN) monitoring and if you want to monitor one location only.

#### Scenarios Requiring Remote Probes

However, there are several situations making it necessary to work with **Remote Probes** in the same LAN or in remote locations. Among these situations are the following:

- You have more than one location and you need to make sure that services are available from all locations.
- Your network is separated in several LANs by firewalls, and the local probe cannot monitor specific services across the firewalls.
- You need to monitor systems in a Virtual Private Network (VPN) across public or in-secure data lines.
- You want to sniff packets on another computer.
- You want to monitor NetFlow data on another computer.
- You experience performance issues with CPU intensive sensors like packet sniffer or NetFlow sensors and need to distribute the load over more than one PC.

The following chart shows an example for a remote probe scenario.

The PRTG core server inside the **Corporate LAN** (bottom right) is able to monitor:

- Services inside the **Corporate LAN** using the **Local Probe**.
- Services behind a firewall in the **Corporate LAN** using **Remote Probe 1**.
- Secured services inside the **Branch Office** (top left) using **Remote Probe 2**.

- Secured services on **Mail Server** and **Web Server** using **Remote Probe 3** and **Remote Probe 4** installed directly on these servers.
- Public services on the internet using any of the probes.

## How Probes Work

As soon as a probe is started, it automatically connects to its [core server](#)<sup>[78]</sup>, downloads the sensor configuration, and begins its monitoring tasks. The core server sends new configuration data to a probe as soon as the monitoring configuration is changed by the user. Probes monitor autonomously and send the monitoring results back to the core server for each check they have performed.

If the connections between core and probe fails for any reason (for example, a reboot of the computer running the core server) the probe continues its monitoring and stores the results. During a connection loss a buffer stores a maximum of 500,000 sensor results in RAM memory of the remote probe system (up to 50 - 200 MB). This means that for 100 sensors with one minute interval the monitoring results of up to 3 days can be buffered (or 52 minutes for 10,000 sensors with one minute interval). The probe automatically reconnects to the core as soon as it is available again and transmits all monitoring results gathered during the connection loss.

The connection between probe and core is initiated by the probe, secured using Secure Sockets Layer (SSL). This means that the data sent back and forth between core and probe is not visible to someone capturing data packets. The core server provides an open TCP/IP port and waits for connection attempts from probes. If a new probe connects for the first time, the administrator will receive a **ToDo** [ticket](#)<sup>[149]</sup> and will then see the new probe in the device tree.

As a security precaution, the probe must be manually acknowledged by the administrator in the device tree before any sensors can be created and monitored. The administrator can also deny a probe which will then be disconnected. No further connection attempts will be accepted and the probe IP is added to the **Deny IPs** list in the probes system settings (see [System Administration—Core & Probes](#)<sup>[1849]</sup> section). This ensures that unauthorized probes cannot connect to a core server.

Because the probe initiates the connection, you must ensure that a connection can be established from the outside world onto your core server. For example, you may need to open any necessary ports in your firewall and you may need to specify a Network Address Translation (NAT) rule for your network. The process is the same as if you wanted to allow access to the web server provided by the PRTG core server via port 443, for example. Usually it is sufficient to open or forward TCP port **23560** (default) on the machine that runs the core server; on probe side it is **not** necessary to open any port in most cases.

## Automatic Probe Update

Whenever a new version of PRTG is installed on the core server, all remote probes will automatically download and install the updated version of the probe as soon as they reconnect to the updated core installation.

The local probe has already been updated during the core installation. All remote probes are automatically downloading the new binaries using the SSL-secured probe/core connection. The download of the 4 MB file takes between a few seconds (in a LAN) and a few minutes (via internet connections), depending on the available bandwidth. As soon as the update has been downloaded the probe disconnects, installs the update and reconnects to the core server. This takes between 20 and 100 seconds. Please note that during the update phase the monitoring of the local probe can be affected due to the bandwidth required for the downloads.

- [Remote Probe Setup](#)  2059

Video Tutorial: There is a video available on the Paessler video tutorials page.

- [http://www.paessler.com/support/video\\_tutorials](http://www.paessler.com/support/video_tutorials)

## 12.8.2 Remote Probe Quick Setup

PRTG provides an easy, semi-automatic install mechanism for a new Remote Probe. You can perform a remote installation of a probe directly in PRTG's web interface by right-clicking on a device in the PRTG device tree. **Note:** This is an experimental feature. It is possible that direct installation does not work in all situations. In this case, please see [Debugging](#) and [Remote Probe Setup Using Installer](#).

In order to install a Remote Probe directly from the web interface, follow the steps below:

- [Step 1: Meeting Requirements](#)
- [Step 2: Preparing Core Server](#)
- [Step 3: Providing Credentials](#)
- [Step 4: Installing Remote Probe](#)
- [Step 5: Approving New Remote Probe](#)

Please look carefully at the requirements in the first three steps.

### Step 1: Meeting Requirements

There are some conditions which have to be met in order to install a probe remotely on another computer. Please ensure the following:

- The target computer must be running with operating system Windows (XP or later).
- The target computer must be accessible through Remote Procedure Call (RPC). This is usually the case when your PRTG server and the target computer are located in the same LAN segment. Otherwise, open Windows **services.msc** on the target computer. Start the Remote Procedure Call (RPC) service.
- You cannot install a remote probe on a probe device.
- You have to permit programs to communicate through your Windows Firewall. Open the settings of your Firewall and choose **Allow programs to communicate through Windows Firewall**. Mark the checkbox for **Remote Service Management**, and the checkbox **Public** in the corresponding line.
- You cannot install a remote probe on the computer where PRTG's Core Server runs.
- The IP address setting for probe connections to the core server must not be **127.0.0.1**. Please see [Step 2](#) how to prepare the **Core Server**.

### Step 2: Preparing Core Server

Before remote probes can connect to the core server, you have to edit the relevant settings in [System Administration—Core & Probes](#).

By default, a core server accepts connections **from the Local Probe only** (this is, IP address **127.0.0.1**). This setting does not allow for remote probes. It is the most secure setting. In order to allow external probes to connect, please choose **Setup | System Administration | Core & Probes** from the main menu, and in the **Probe Connection IPs** section, choose one of the following options:

- **All IPs available on this computer:** We recommend using this setting for easy setup (this is, IP address **0.0.0.0**).
- **Specify IPs:** Specify the IP addresses that will accept incoming connections.
- As **Probe Connection Port**, you can leave the standard port number, even when configuring several probes. Please make sure this port is not blocked by firewall rules on your core server's side.

Probe Connection Settings in System Administration

When you are done, click **Save** to save your settings. The core server process must be restarted so that the changes take effect.

**Note:** If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the [Enterprise Console](#)<sup>1894</sup>, or of [Smart phone Apps](#)<sup>1950</sup> will be disconnected. After clicking on the **Save** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen.

For detailed information about these settings, please see [System Administration—Core & Probes](#) <sup>1849</sup> section.

### Step 3: Providing Credentials

If not done yet, [add a device](#) <sup>272</sup> to PRTG that represents the target computer where you want to install the remote probe on. You have to set the correct Windows credentials for this device.

- Open the [Device Settings](#) <sup>272</sup>.
- In the **Credentials for Windows Systems** section, provide **Domain or Computer Name**, **Username**, and **Password** for the target computer.
- You can also [inherit](#) <sup>87</sup> the credentials from its parents' settings.

Please make sure that this user account has administration rights on the target computer.

### Step 4: Installing Remote Probe

- In the device tree overview, open the [context menu](#) <sup>168</sup> of the target device.
- Choose **Device Tools > Install Remote Probe....**
- The install assistant will appear on a new page.

## Part 12: Advanced Topics | 8 Add Remote Probe

## 2 Remote Probe Quick Setup

**PRTG Network Monitor**

Home Devices Libraries Sensors Alarms Maps Reports Logs ToDo's Setup

Devices Install Remote Probe on Device

## Install Remote Probe on Device Example Device

**Please note:** This is an experimental feature, it may not work in all possible situations. Please send your feedback to [support@paessler.com](mailto:support@paessler.com).

You are about to install a Remote Probe of PRTG on the computer "Example Device". This will allow PRTG to monitor this computer locally instead of using remote monitoring features which can sometimes be a good workaround for performance or authentication problems (e.g. for WMI sensors). Additionally this will allow you to use some probe-only sensors like Packet Sniffing, xFlow/NetFlow and others.

Details	
Device Name	Example Device (example.com)
Status	OK
Priority	★★★★☆
Parent Probe	Local probe (Local Probe on 127.0.0.1)
Parent Group	User Group home
Sensors by State	(Total: 0)

### Prerequisites

Please make sure the following conditions are met:

- The target computer must be a Windows PC (Windows XP or later).
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Windows credentials must be set in the device settings or its parents' settings (Current user name: examplecom\johnpublic) and the user account must have administration rights on the target machine.
- IP address setting for probe connections to the core server must not be 127.0.0.1 (Current setting: 0.0.0.0). You can change this setting in the Core Server Administrator.

### Start Probe Installation

The installation will take between 10 and 100 seconds.

**Install Remote Probe on "Example Device"**

Remote Probe Install Assistant

The install assistant is divided into four sections:

- Experimental feature notice and short introduction
- **Details:** overview about the device, this is, name, status, priority, parent probe, parent group, and sensor states in place with their number
- **Prerequisites:** for details, see [Step 1](#) <sup>2056</sup>
- **Start Probe Installation:** time estimation for installation and installation start button

If prerequisites are not met, you cannot start the installation process. Open requirements will be highlighted in red. Please correct these to continue!

### Prerequisites

Please make sure the following conditions are met:

- The target computer must be a Windows PC (Windows XP or later).
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- You can not install a remote probe on a probe device.
- Please correct before proceeding:** Windows credentials must be set in the device settings or its parents' settings (Current user name: \) and the user account must have administration rights on the target machine.
- IP address setting for probe connections to the core server must not be 127.0.0.1 (Current setting: 0.0.0.0). You can change this setting in the Core Server Administrator.

### Start Probe Installation

Sorry, you can not continue. Please correct the highlighted items above!

Installation Unable to Start due to Unmet Prerequisites

If all prerequisites are met, you can install the remote probe on the target computer by clicking the button **Install Remote Probe on "[device name]"**. Wait until the process has ended. If installation was successful, the following message will appear in the **Start Probe Installation** section: **Done. Result is: OK.**

**Note:** Every time you start an installation, no matter if it is successful or not, a key will be added automatically to **Access Keys** in [System Administration—Core & Probes](#) <sup>1849</sup>.

## Step 5: Approving New Remote Probe

If installation was successful, further instructions are given after the result message. As indicated, go back to the [device tree](#) <sup>109</sup> and acknowledge the new probe. The approval button will appear at the bottom of the devices list. You will also get a new [ToDo ticket](#) <sup>150</sup>.

Approve new probe

Deny new probe

Approving New Remote Probe

Click on **Approve new probe** to acknowledge the created remote probe. You can also discard the new probe by clicking **Deny new probe**.

**Note:** When denying or removing a remote probe, this device's global ID (GID) will be entered to **Deny GIDs** in [System Administration—Core & Probes](#) <sup>1849</sup>.

**Note:** Denying the remote probe in the PRTG device tree does **not** uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

After approving, the approval button will turn into a **Working** status. Please wait while the probe connects. Once approved, PRTG automatically creates a set of sensors for the probe to ensure that bottle-necks on the probe will always be noticed. We recommend keeping these sensors. You are able now to create groups, devices and sensors for monitoring via the new probe.

## Debugging

Please be aware that installing a remote probe from PRTG's web interface is an experimental feature. Thus, it can be the case that this approach is not possible in all situations.

However, please follow the steps of this chapter closely when encountering problems with the Remote Probe Quick Install. Especially consider the conditions as described in [Step 1](#)  of this chapter like Windows Firewall settings.

If the quick installation procedure described in this section does not work with your setup, please install your remote probes manually; see section [Remote Probe Setup Using Installer](#) .

### 12.8.3 Remote Probe Setup Using Installer

This section will guide you through the steps to set up a remote probe using the **Remote Probe Installer**. For a semi-automatic installation of a Remote Probe directly from PRTG's web interface, see section [Remote Probe Quick Setup](#)<sup>[2053]</sup>.

- [Step 1: Preparing Core Server](#)<sup>[2059]</sup>
- [Step 2: Download and Install Remote Probe](#)<sup>[2061]</sup>
- [Step 3: Configure Remote Probe Connection](#)<sup>[2061]</sup>
- [Step 4: Approve New Probe and Start Monitoring](#)<sup>[2062]</sup>
- [Debugging Probe Connection Problems](#)<sup>[2062]</sup>

There are preparations to do on the core server, so it accepts incoming remote probe connections. Then you log in to the computer you want to install the remote probe on, download the installer from your PRTG web interface, and install it.

#### Step 1: Preparing Core Server

Before remote probes can connect to the core server you must edit the relevant settings in the [System Administration—Core & Probes](#)<sup>[1848]</sup>. Login to the [Ajax web interface](#)<sup>[102]</sup>. From the main menu, select **Setup | System Administration | Core & Probes** to access the probes settings.

By default, a core server accepts connections **from the Local Probe only** (this is, IP address **127.0.0.1**). This setting does not allow for remote probes. It is the most secure setting. In order to allow external probes to connect, please choose **Setup | System Administration | Core & Probes** from the main menu, and in the **Probe Connection IPs** section, choose one of the following options:

- **All IPs available on this computer:** We recommend using this setting for easy setup (this is, IP address **0.0.0.0**).
- **Specify IPs:** Specify the IP addresses that will accept incoming connections.
- As **Probe Connection Port**, you can leave the standard port number, even when configuring several probes. Please make sure this port is not blocked by firewall rules on your core server's side.

## Part 12: Advanced Topics | 8 Add Remote Probe

☐ Allow Mini Probes to connect

Probe Connection Settings in System Administration

- From the **Access Keys** field, copy one access key you will use for the remote probe connection. You can also enter a new access key with arbitrary signs and length if you like. In any case save the correct access key for later use.
- In the **Allow IPs** field, enter the IP address of the computer you will install a remote probe on. To make things easier, you can also enter the word **any**; this will set the core server to accept remote probes connecting from any IP address. **Note:** If you use **any**, please make sure you write the word in lower case only! Any other variations will not be recognized!
- Make sure the IP address of the computer you will install a remote probe on is not listed in the **Deny IPs** field.
- When you are done, click **Save** to save your settings. The core server process must be restarted so that the changes take effect.

**Note:** If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the [Enterprise Console](#)<sup>1894</sup>, or of [Smart phone Apps](#)<sup>1850</sup> will be disconnected. After clicking on the **Save** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen.

For detailed information about these settings, please see [System Administration—Core & Probes](#)<sup>1840</sup> section.

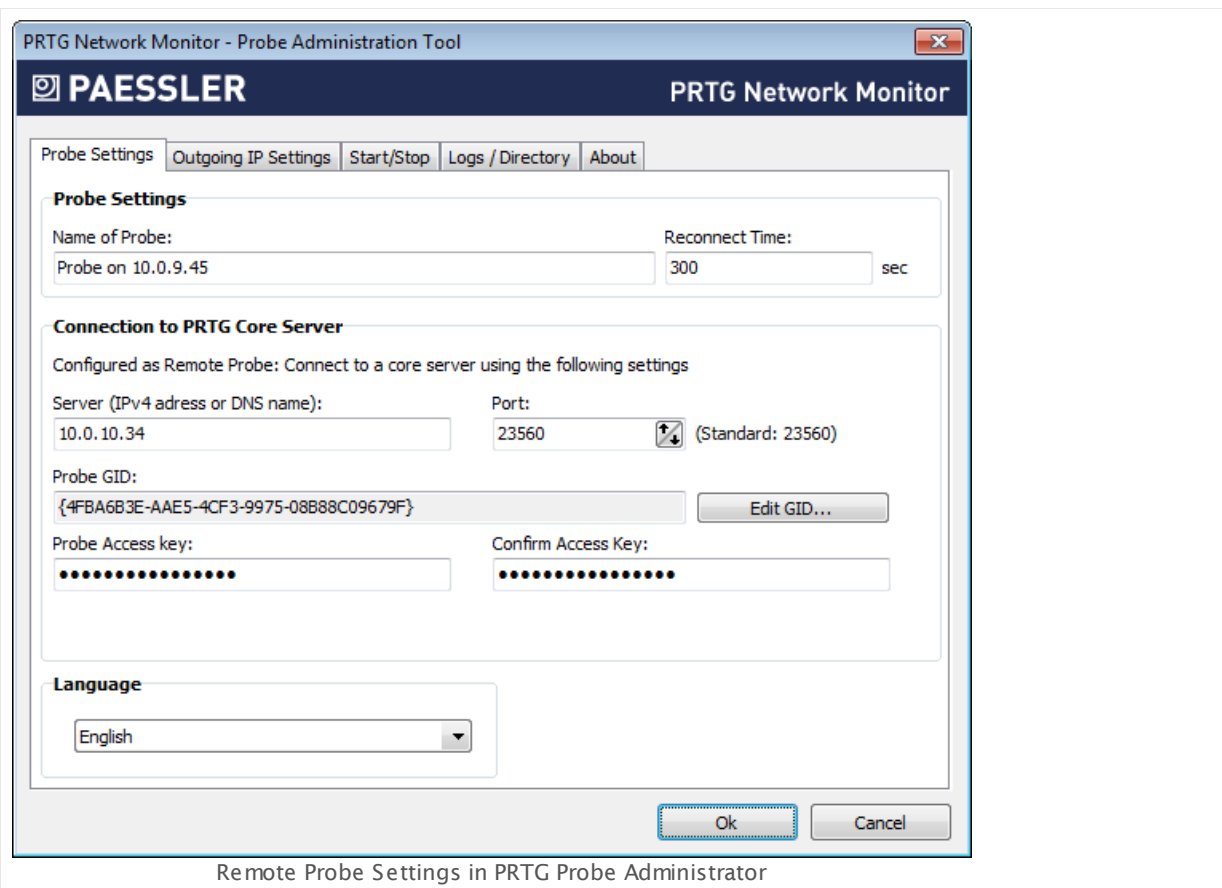

## Step 2: Download and Install Remote Probe

From the computer you want to install a remote probe on, connect to the [Ajax web interface](#) [102], download the setup file, and install it. For detailed instructions, please see [Install a PRTG Remote Probe](#) [62] section. **Note:** You cannot install a remote probe on a system already running a PRTG core installation.

At the end of the remote probe installation the **PRTG Probe Administrator** will be started (or you can start it manually from the Windows start menu later).

## Step 3: Configure Remote Probe Connection

In the [PRTG Probe Administrator](#) [2016] on the Windows system you have installed the remote probe on, please configure the connection to the core server.

In the **Connection to PRTG Core Server** section, you can then edit the following settings:

- **Server:** Enter the IP address or DNS name of the core server the remote probe will connect to. If Network Address Translation (NAT) is used, this must be the IP address that is externally visible, as the remote probe will connect from outside of your network.

- **Port:** Enter the port number the remote probe will connect to on the core server. This number must match the one set in [Step 1](#)<sup>2059</sup>.
- **Probe Access Key and Confirm Access Key:** Enter the access key the probe will send to the core server. You have saved this key in [Step 2](#)<sup>2061</sup>. This key has to match exactly the one shown in the web interface's probes settings, so a connection can be established.

For detailed information about these settings, please see [PRTG Probe Administrator](#) section. Click the **Ok** button to confirm your settings and to start the probe service.

## Step 4: Approve New Probe and Start Monitoring

When a new probe connects to the core server for the first time, a new [ToDo ticket](#)<sup>[150]</sup> will be created and the probe will show up as a new object in the device tree of your setup.

Please click on **Approve new probe** to fully enable the probe. You have to do this once for every new probe. Once approved, PRTG automatically creates a set of sensors for the probe to ensure that bottle-necks on the probe will always be noticed. We recommend keeping these sensors. You can now create groups, devices and sensors for monitoring via the new probe.

You can also discard the new probe by clicking **Deny new probe.**

**Note:** When denying or removing a remote probe, this device's global ID (GID) will be entered to **Deny GIDs** in [System Administration—Core & Probes](#).

**Note:** Denying the remote probe in the PRTG device tree does **not** uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

## Debugging Probe Connection Problems

If you have trouble with the setup of remote probes please look at the probe's log files.

The probe process writes log files with a file name in the format **PRTG Probe Log (x).log**. Please open the one with the most recent date.

For a correct connection the probe log should look similar to this:

```
11.08.2012 16:15:15 PRTG Probe Server V12.3.2.5101
11.08.2012 16:15:15 Starting Probe on "WINXPVMWARE"
11.08.2012 16:15:15 Data Path: C:\documents and settings\All Users\a[...]
11.08.2012 16:15:15 Local IP: 0.0.0.0
11.08.2012 16:15:15 Core Server IP and Port: 10.0.2.167:23560
11.08.2012 16:15:15 Probe ID: -1
11.08.2012 16:17:01 Connected to 10.0.2.167:23560
11.08.2012 16:17:06 Login OK: Welcome to PRTG
```

If the connection fails, for example, due to an incorrect **Access Key**, or due to incorrect **IP** settings (see [Step 2](#)<sup>2061</sup>), you will see:

```
11.08.2012 16:31:02 Try to connect...  
11.08.2012 16:31:02 Connected to 10.0.2.167:23560  
11.08.2012 16:31:07 Login NOT OK: Access key not correct!
```

## 12.9 Failover Cluster Configuration

PRTG offers single failover clustering in all licenses—even using the freeware edition. A single failover cluster consists of two servers ("Current Master" Node and "Failover Node"), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data.

For setting up a cluster you need two or more servers and there is one [core installation](#)<sup>57</sup> necessary on each of them—with different settings configured for each type of node. In return, you benefit from seamless high-available monitoring with automatic failover and/or multi-location monitoring.

In a cluster, you can run:

- **1 Master Node**  
On the master node, you set up your devices and configuration. Also notifications, reporting, and many other things are handled by the master node.
- **Up to 4 Failover Nodes**  
You can install one, two, three, or four additional nodes for fail-safe, gapless monitoring. Each of these nodes can monitor the devices in your network independently, collecting their own monitoring data. The data can be reviewed in a summarized way, enabling you to compare monitoring data from different nodes.

**Note:** During an outage of one node, you will see data gaps for the time of the outage on that node. However, data for that time span will still be available on all other cluster nodes.

### Before Getting Started

Configuring a cluster with one failover node is the most common way to set up a seamless network monitoring with PRTG. You will need two servers running any Windows version (XP/2003 or later); your servers can be real hardware (**recommended!**) or virtual machines.

Please make sure the following:

- Your servers must be up and running.
- Your servers must be similar in regard to the system performance and speed (CPU, RAM memory, etc.).

- In a cluster setup, each of the cluster nodes will individually monitor the devices added to the **Cluster Probe**. This means that monitoring load will increase with every cluster node. Please make sure your devices and network can handle these additional requests. Often, a larger scanning interval for your entire monitoring is a good idea. For example, you could set a scanning interval of 5 minutes in the [Root Group Settings](#)<sup>224</sup>.
- We recommend installing PRTG on dedicated real-hardware systems for best performance.
- Please bear in mind that a server running a cluster node may in rare cases be rebooted automatically without notice (e.g. for special software updates).
- Both servers must be visible for each other through the network.
- Communication between the two servers must be possible in **both directions**. Please make sure that no software- or hardware firewall is blocking communication. All communication between nodes in the cluster is directed through one specific TCP port. You will define it during cluster setup (by default, it is **TCP port 23570**).
- A Failover Master will send notifications in case the Primary Master is not connected to the cluster. In order for mails to be delivered in this case, please make sure you configure the [Notification Delivery](#)<sup>1845</sup> settings in a way they can be used to deliver emails from your Failover Node as well (for example, using the option to set up a secondary Simple Mail Transfer Protocol (SMTP) server).
- Make your servers safe! From every cluster node, there is full access to all stored credentials as well as other configuration data and the monitoring results of the cluster. Also, PRTG software updates can be deployed through every node. So, please make sure you take security precautions to avoid security attacks (hackers, Trojans, etc.) You should secure every node server the same careful way as the master node server.
- Run the nodes in your cluster either on 32-bit or 64-bit Windows versions only. Avoid using both 32-bit and 64-bit versions in the same cluster, as this configuration is not supported and may result in an unstable system. Also, ZIP compression for the cluster communication will be disabled and you may encounter higher network traffic between your cluster nodes.
- If you run cluster nodes on Windows systems with different timezone settings and use [Schedules](#)<sup>1827</sup> to pause monitoring of defined sensors, schedules will apply **at the local time of each node**. Because of this, the overall status of a particular sensor will be shown as **Paused** every time the schedule matches a node's local system time. Please use the same timezone setting on each Windows with a cluster node in order to avoid this behavior.

## Start Now!

Knowledge Base: PRTG Cluster: How do I convert a (temporary) Failover Master node to be the Primary Master node?

- <http://kb.paessler.com/en/topic/34853>

## 12.9.1 Failover Cluster Step by Step

This section will guide you through a step-by-step process to set up a failover cluster. Please follow these instructions carefully, in order to successfully integrate two or more PRTG installations into one failover cluster.

**Note:** Before getting started, please make sure you've read the information in section [Failover Cluster Configuration](#) .

### Step 1: Install Core Servers

We will start with setting up a single failover cluster, consisting of two PRTG core server installations, each running on an individual server. Please use your license key twice to install the PRTG core server on two different computers.

If you already run an installation of PRTG, this will be your future Master Node. In this case, please install a second core server on another computer only. Make sure you use the same license key for both installations.

Before you begin to set up a cluster, please make sure you run exactly the same PRTG version (build number) on all (future) nodes (install updates for existing installations, if necessary).

**Note:** Once the cluster is established, any updates you install on one node will be deployed to all other cluster nodes automatically.

For details about the installation process, please see [Install a PRTG Core Server](#) .

### Step 2: Configure Master Node

Decide which of your PRTG core server installations will be your future Master Node. If you already run an installation of PRTG in your network for some time, this should be your master, so your existing monitoring configuration is being kept.

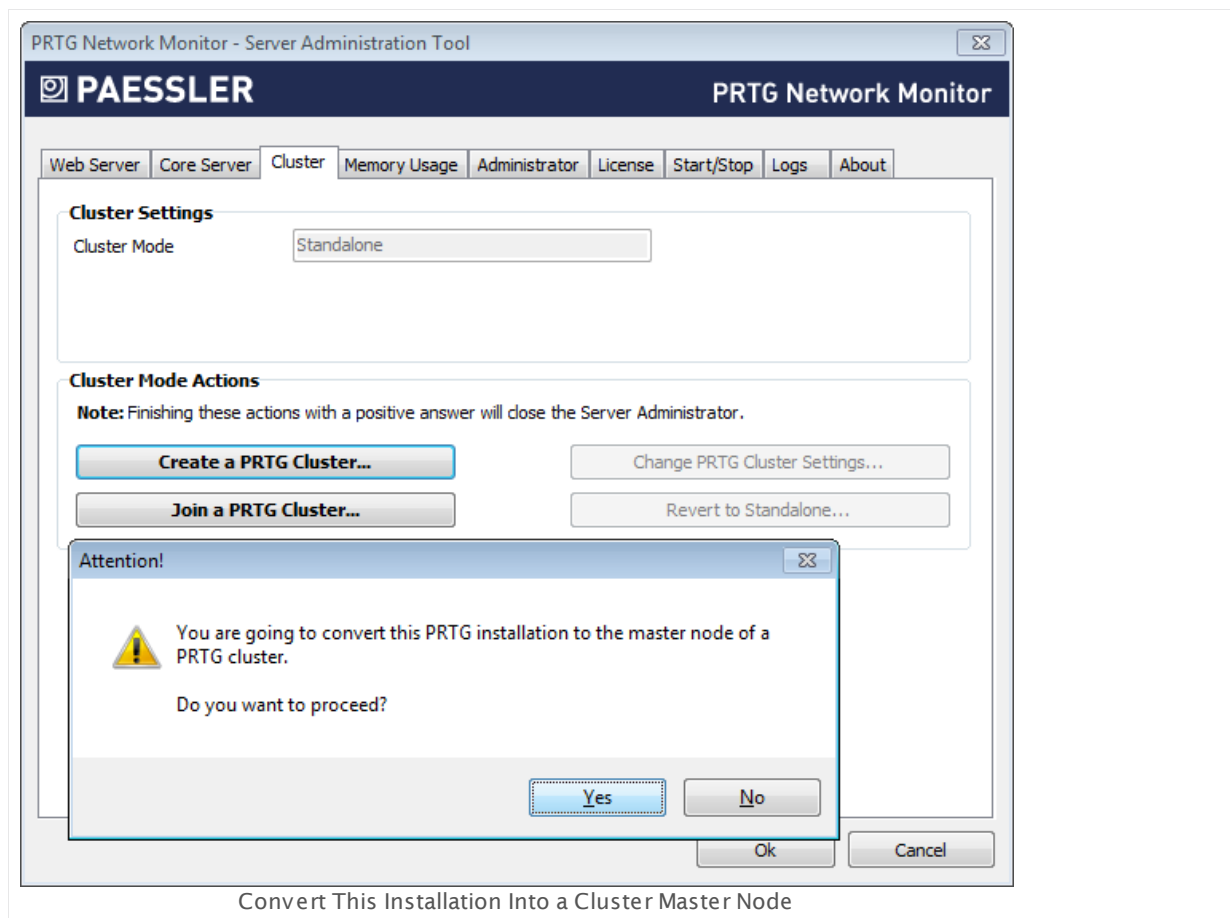

On the Master Node server, from the Start menu, open the [PRTG Server Administrator](#)  program. In the Cluster tab, click on the following button:

#### Create a PRTG Cluster...

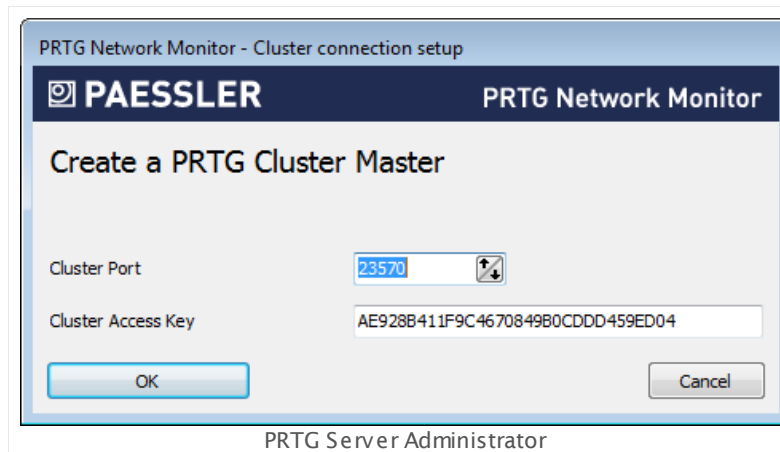

- Start creating a cluster by clicking this button. The current PRTG core server will then be the **Master Node** of your cluster.
- After you click this button, please confirm converting this installation into a master node by clicking on the **Yes** button.

## Part 12: Advanced Topics | 9 Failover Cluster Configuration

## 1 Failover Cluster Step by Step

- A new popup window will appear.

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.

- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend using the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your Failover Node(s).
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

### Step 3: Configure Failover Node

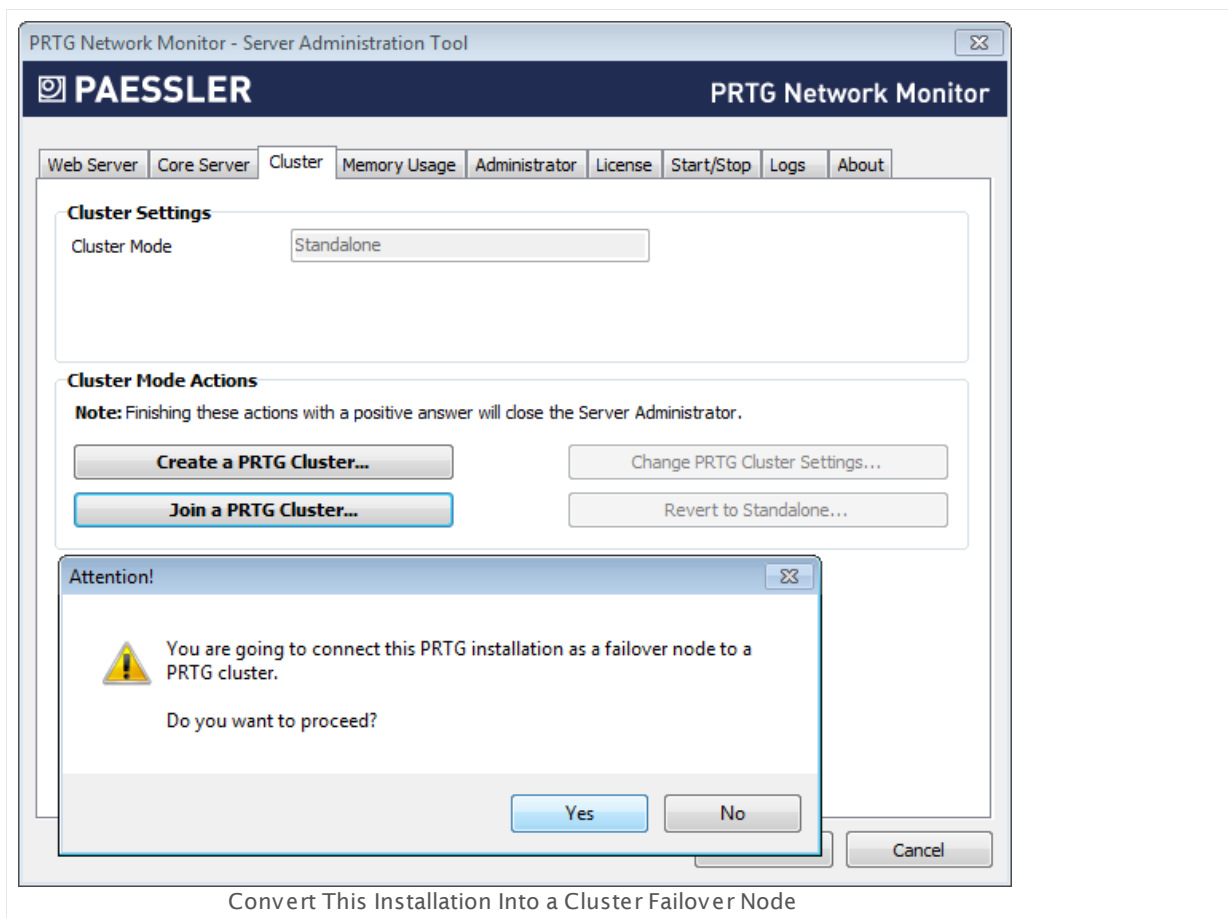

On the server that will be your Failover Node, from the Start menu, open the [PRTG Server Administrator](#)  program. In the Cluster tab, click on the following button:

#### Join a PRTG Cluster...

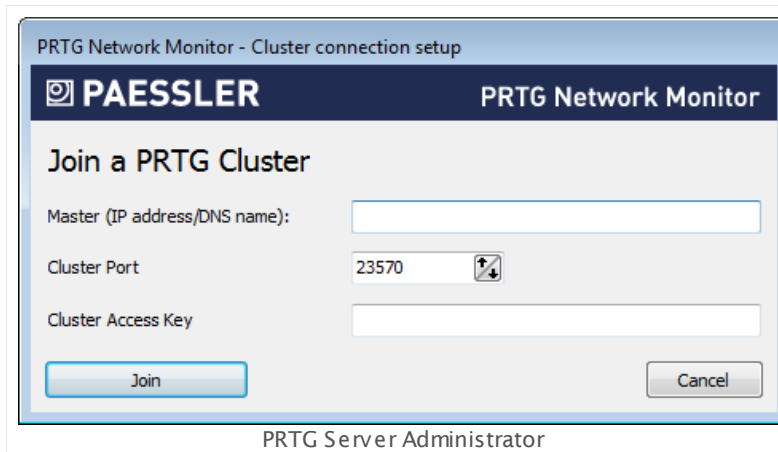

- Add this installation to an existing cluster which already has a **Master Node**, by clicking this button. The current PRTG core server will then be a **Failover Node** in the cluster.
- **Note:** This button is also available if you're currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- After you click this button, please confirm converting this installation into a failover node by clicking on the **Yes** button.

## Part 12: Advanced Topics | 9 Failover Cluster Configuration

## 1 Failover Cluster Step by Step

- A new popup window will appear.

- Enter the cluster's **Master IP address/DNS name**. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in your **Master Node's** settings. Please make sure you use the same settings on all nodes in your cluster.

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

## Step 4: Confirm Failover Node

Now you need to confirm the new failover node by setting it to **Active** in the master node's settings.

In a browser window, log into PRTG's [web interface](#)<sup>102</sup> of the **Master Node** server.

In the [System Administration—Cluster](#)<sup>1856</sup> settings, you will see your “Master Node” server in the first line of the cluster list and your “Failover Node” server below.

**System Setup**

System, Website, and Web Server Settings | Notification Delivery Settings | Probe Management | **Cluster Settings**

Node Name	Node ID	Node State	IP/DNS Names used for Connections Between Nodes
1 PRTG Network Monitor IP: CBC	25C	Active	#2 = #1 #3 = #1 #4 = #1 #5 = #1
2 PRTG Network Monitor IP: 276	7D5	<input checked="" type="radio"/> Active <input type="radio"/> Inactive	#1 = #2 #3 = #2 #4 = #2 #5 = #2
3		<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 = #3 #2 = #3 #4 = #3 #5 = #3
4		<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 = #4 #2 = #4 #3 = #4 #5 = #4
5		<input type="radio"/> Active <input checked="" type="radio"/> Inactive	#1 = #5 #2 = #5 #3 = #5 #4 = #5

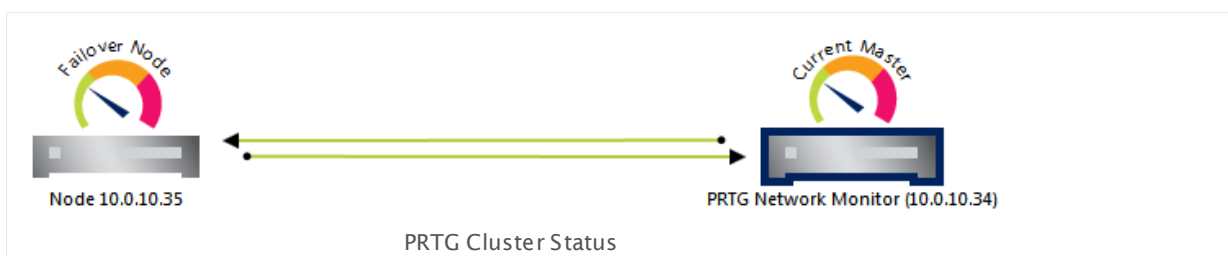

Save Changes

SystemSetup Cluster Settings

For the “Failover Node”, set the radio button for **Node State** to **Active** and **Save** the changes. The nodes will now connect and exchange configuration data. This may take a few minutes.

## Step 5: Check Cluster Connection

In two browser windows, log into PRTG's web interfaces of **both** of your PRTG installations. Open the cluster status page in both windows by clicking on the narrow cluster information bars at the top of each window. You should see a cluster status with your two nodes in a **Connected** state after a few minutes.

CLUSTER STATUS		
<b>Node 1: PRTG Network Monitor (10.0.10.34)</b>		
Primary Node (Current Master)		<a href="#">Start Maintenance Mode</a>
Connection To	IP	State
⇒ Node 10.0.10.35	10.0.10.35	Connected
<b>Node 2: Node 10.0.10.35</b>		
Secondary Node (Failover Node, Version: 28665)		<a href="#">Start Maintenance Mode</a>
Connection To	IP	State
⇒ PRTG Network Monitor (10.0.10.34)	10.0.10.34	Connected
PRTG Cluster Status		

## Step 6: Trouble Shooting

Having any problems? If your nodes cannot connect, please see

- the Cluster Log entries on the [PRTG Status—Cluster Status](#) <sup>1883</sup> page of the web interface
- the core server log file, a text file in the logs directory of your PRTG data folder (see [Data Storage](#) <sup>2074</sup>).

In the latest entries of these logs, you can see messages about any errors that might have occurred. These will give you hints on where to find a solution.

If you encounter connection problems between the two cluster nodes, please make sure that no software- or hardware firewall is blocking communication on the cluster port defined during cluster setup. Communication between the nodes must be possible in **both directions** in order for the cluster to work properly.

## Step 7: Done! Move Sensors to the Cluster Probe Now

That's it. You've now successfully set up your failover cluster. All devices that are created or moved under the **Cluster Probe** will be monitored by both servers.

**In order to monitor your existing configuration via all cluster nodes, on your master node, please move your groups, devices, and sensors from the local probe to the cluster probe!** Objects, including their settings, will then be transferred to all cluster nodes automatically.

## Add More Failover Nodes

If you want to add an additional failover node to your cluster, you will need an additional license key for two and three failover nodes, and two additional license keys to run four failover nodes. **Note:** In a cluster, only core servers running on the same size of [license](#)<sup>19</sup> can be combined. For example, you can use several "PRTG Unlimited" licenses or several "PRTG 1000" licenses in one cluster.

To add another failover node to your cluster, please set up a new PRTG core server installation on a new server, using an additional license key. Then proceed with [Step 3](#)<sup>2069</sup> and following. **Note:** Use a second license key to set up both your second and third failover node, and use a third license key to set up your fourth failover node. The licenses "Site" and "Corporate" can be used to install an unlimited number of core servers.

Each failover cluster is technically limited to five cluster nodes: As a maximum, you can run one master node and four failover nodes in one cluster.

## 12.10 Data Storage

PRTG stores the monitoring configuration, monitoring data, logs, tickets, and reports, as well as support and debug data into different folders on the core server or the system running a [Remote Probe](#)<sup>[2049]</sup>. Additionally, there is data from PRTG in the program directory and the Windows registry.

Data can be found in different locations. For a detailed information please see the article linked in the [More](#)<sup>[2075]</sup> section below.

### PRTG Program Directory

32 bit systems:

```
%programfiles%\PRTG Network Monitor
```

64 bit systems:

```
%programfiles(x86)%\PRTG Network Monitor
```

**Note:** These are the default paths. If you specified another installation directory, you will find your data there.

### PRTG Data Folder

On Windows Vista, Windows 7, Windows 2008, Windows 8, and Windows 2012:

```
%programdata%\Paessler\PRTG Network Monitor
```

On Windows XP and Windows 2003:

```
%ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor
```

**Note:** These are the default paths, depending on your Windows version. If you specified a custom path for data storage, please look it up in the [PRTG Server Administrator](#)<sup>[2002]</sup>. Open this application and switch to the **Core Server** tab. You will find the path there.

### Windows Registry

System settings on 32 bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor
```

**System settings on 64 bit systems:**

```
HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor
```

**Enterprise Console settings:**

```
HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI
```

## 12.11 Using Your Own SSL Certificate with PRTG's Web Server

This section will give you a brief overview on how to use your own trusted SSL certificate files with the PRTG web server.

### What is SSL?

PRTG supports Secure Sockets Layer (SSL) to encrypt all data entered and shown in the [Web Interface](#)<sup>[100]</sup>, in the [Enterprise Console](#)<sup>[1094]</sup>, or in the [Smartphone Apps](#)<sup>[1950]</sup>. That ensures that no sensitive information can be intercepted when sending data between the PRTG core server and your client software.

By default PRTG is already delivered with an SSL certificate so you can use secure connections to your PRTG core server. However, these certificate files are not signed by a valid authority, which is why browsers show an [SSL Certificate Warning](#)<sup>[105]</sup> when you try to access the web interface. Despite this warning your connection is still encrypted successfully.

To remove the browser warning you can obtain a certificate that is valid for your own domain name and signed by a valid authority. The certificate must be provided in the correct format and can then be copied to your PRTG program directory (see [Data Storage](#)<sup>[2074]</sup>).

### PRTG Needs PEM Encoded Format and Unencrypted Key

There are many different issuers for certificates, and there are different formats certificates can be provided in.

PRTG needs three different files, named correctly, containing data in the expected encoding and format:

- **prtg.crt**: This is the certificate for your PRTG server. It has to be stored in **PEM** encoded format.
- **prtg.key**: This is the private key matching your server certificate. It has to be stored in **PEM** encoded format and may not be encrypted! Please make sure that you provide this file in **decrypted** format! The best way to check this is to open the file in a text editor. If you find a line containing the word "ENCRYPTED", the file still needs to be decrypted before you can use it with PRTG. Please decrypt using an SSL tool (e.g. OpenSSL) and your key password.
- **root.pem**: This is the public root certificate of your certificate's issuer. It has to be stored in **PEM** encoded format and must contain all necessary root certificates of your issuer in one file. If there is more than one PEM encoded root certificate, please use a text editor to copy all of them into a single file (the order does not matter).

Once ready, copy these three files to the **/cert** sub folder of your PRTG program directory (please backup existing files) and restart your PRTG core server service (see [PRTG Server Administrator](#)<sup>[2012]</sup>). **Note:** PRTG services won't restart if the files are not provided in exactly the expected format!

For detailed instructions and examples, installation descriptions for various certificates (including **Wildcard** certificates), as well as links to certificate tools and converters, please see the [More](#)<sup>2077</sup> section below.

## 12.12 Calculating Percentiles

Wikipedia describes a percentile as **the value of a variable below which a certain percent of observations fall**. Providers often use it in their billing models, e.g. when determining the used bandwidth. With percentile calculation, you can cut off an x percent of peak values from an amount of values.

In PRTG, you can calculate percentiles when creating general reports (see [Reports](#)<sup>1775</sup> section), or creating historic data reports of a certain sensor (see [Historic Data Reports](#)<sup>133</sup> section). If you activate the **Percentile Results** option in your reports' settings, the according values will be added to the tables. You can customize the following settings:

- **Percentile:** Enter the percentile number you want to calculate. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded.
- **Percentile Average:** This is the averaging interval in seconds, which is used for percentile calculation. Default value is 300 which is equivalent to 5 minutes.

**Percentile Mode:** Choose between **Discrete** and **Continuous**. Continuous percentile interpolates between discrete values, whereas discrete percentile chooses the next smaller discrete value.

- **Discrete** percentile means that the value must be a member of the data set. For this kind of calculation you require a discrete distribution. The median of a discrete distribution can not be defined, as such, meaning that the 50th discrete percentile may not necessarily be the median if the value does not belong to an odd number of measurements. Discrete percentiles, as such, should not be used for billing applications.
- **Continuous** percentile basically means that the measurements are treated as a statistical population and the value is determined by interpolating a value when it isn't present. This means that values are interpolated between actual measurements that are varying around the "perfect" center of the measurements.

# Part 13

## Appendix

# 13 Appendix

Please find further information in the following sections.

- [Glossary](#)  2081
- [List of Abbreviations](#)  2085
- [Support and Troubleshooting](#)  2088
- [Legal Notices](#)  2089

## 13.1 Glossary

This section explains special words used in the context of PRTG Network Monitor. **Note:** Here, only explanations are given. For information on where to find detailed instructions for a specific key word, please see the **Index** section.

### Channel

The monitoring data of a [sensor](#)<sup>[2084]</sup> is shown in sensor channels. For example, for sensors that measure network traffic, there is one channel each for traffic **in** and traffic **out**. You can set various triggers for each channel, enabling you to set sensor status changes or notifications based on the monitoring data received.

### Cluster

PRTG can be configured as a failover cluster for fail-safe monitoring. In a cluster, one or more [core servers](#)<sup>[2081]</sup> work together in one configuration. Every node can monitor all devices in a network for gapless monitoring, additionally enabling you to compare monitoring results measured from different perspectives.

### Cluster Node

Sometimes used as synonym for [Node](#)<sup>[2083]</sup>.

### Cluster Probe

When running PRTG in cluster mode, a cluster probe is automatically created. All [objects](#)<sup>[2083]</sup> created on the cluster probe, or below it in the [device tree](#)<sup>[2082]</sup>, are monitored by all nodes in the cluster. Create or move [objects](#)<sup>[2083]</sup> there to monitor them fail-safely. If one node fails, the other nodes will continue to monitor them. You can add [groups](#)<sup>[2082]</sup> and [devices](#)<sup>[2082]</sup> to the probe. On a PRTG installation, the cluster probe runs as part of this installation's [local probe](#)<sup>[2082]</sup>. [Remote probes](#)<sup>[2083]</sup> cannot be connected to a cluster probe, but only to one local probe of one PRTG installation.

### Core Server

The central unit of PRTG. It receives monitoring data from the [probe\(s\)](#)<sup>[2083]</sup> and handles reporting and notifications, provides the web server for the user interfaces, and many other things. In a [cluster](#)<sup>[2081]</sup>, one core server is installed on every node.

### Dashboard

In the Home menu of the web interface there are several pre-configured dashboards available which show a quick overview of the overall status of your monitoring configuration. Custom dashboards can be created using the [Maps](#)<sup>[2083]</sup> function.

## Device

A device in PRTG represents a physical device in the network. For an easily understandable tree structure, you usually create one PRTG device for each physical device you want to monitor (exceptions apply to some sensors that can only be created on the [local probe](#)<sup>[2082]</sup> device, and for sensor types that are not bound to a certain device, such as HTTP sensors, which are also usually created on the local probe). You can add one or more [sensors](#)<sup>[2084]</sup> on every device.

## Device Tree

PRTG's configuration is represented in a hierarchical tree structure, called device tree, containing all [objects](#)<sup>[2083]</sup>. While building the tree, you can relate to your network's topology to make your monitoring setup easy to understand.

## Failover Master (Node)

If the [primary master](#)<sup>[2083]</sup> node fails, a [failover node](#)<sup>[2082]</sup> is promoted to current failover master and takes over the master role until the primary master node re-joins the [cluster](#)<sup>[2081]</sup>.

## Failover Node

In a [cluster](#)<sup>[2081]</sup> a failover node monitors all [sensors](#)<sup>[2084]</sup> on the [cluster probe](#)<sup>[2081]</sup>, providing monitoring data for the [core server](#)<sup>[2081]</sup>. Additionally, it serves as a backup in case the [master node](#)<sup>[2083]</sup> fails.

## Group

A group is an organizational unit in your PRTG tree structure that helps to arrange your devices. To existing groups, you can add devices, or additional sub-groups. This way you can model your physical network's topology within the PRTG configuration.

## Library

Libraries are a way to show parts of your [device tree](#)<sup>[2082]</sup> in a different layout or with different filters enabled. There is an editor available that allows creating libraries directly in your browser.

## Local Probe

The local probe is installed together with the [core server](#)<sup>[2081]</sup>. All [objects](#)<sup>[2083]</sup> created on the local probe, or below it in the [device tree](#)<sup>[2082]</sup>, are monitored by the local core system. You can add [groups](#)<sup>[2082]</sup> and [devices](#)<sup>[2082]</sup> to the probe.

## Map

Maps (sometimes referred to as "[dashboard](#)"<sup>[2081]</sup>) are a way to present monitoring the way you want to arrange it. There is an editor available that allows creating maps directly in your browser.

## Master Node

In a [cluster](#)<sup>[2081]</sup>, the master node controls the settings and cluster management. It also takes over notifications. All changes to the monitoring configuration are made on the master node.

## Node

In a [cluster](#)<sup>[2081]</sup> there is one [master node](#)<sup>[2083]</sup> and one or more [failover nodes](#)<sup>[2082]</sup>. On each node, one PRTG [core server](#)<sup>[2081]</sup> installation is running independently. All nodes are connected to each other, exchanging configuration and monitoring data.

## Object

All different items in the [device tree](#)<sup>[2082]</sup> are generally referred to as objects. An object can be a [probe](#)<sup>[2083]</sup>, a [group](#)<sup>[2082]</sup>, a [device](#)<sup>[2082]</sup>, or a [sensor](#)<sup>[2084]</sup>.

## Primary Master (Node)

The **primary** master node in a [cluster](#)<sup>[2081]</sup> is the [node](#)<sup>[2083]</sup> that is master by configuration. Only if it fails, one of the [failover nodes](#)<sup>[2082]</sup> becomes [failover master](#)<sup>[2082]</sup> and takes over the master role until the primary master node re-joins the cluster.

## Probe

On a probe, the actual monitoring takes place. A probe can run as [local probe](#)<sup>[2082]</sup> on the local system where the [core server](#)<sup>[2081]</sup> is installed. There are also [cluster probes](#)<sup>[2081]</sup> and [remote probes](#)<sup>[2083]</sup>.

## Remote Probe

A remote probe is a small piece of software installed on a computer in the local or remote network. It scans the network from there and sends monitoring results to the [core server](#)<sup>[2081]</sup>. Once the connection is established, the remote probe is shown in the PRTG tree structure. All [objects](#)<sup>[2083]</sup> created on the remote probe, or below it in the [device tree](#)<sup>[2082]</sup>, are monitored by the remote system running the remote probe. You can add [groups](#)<sup>[2082]</sup> and [devices](#)<sup>[2082]</sup> to the probe. In [cluster](#)<sup>[2081]</sup>, remote probes can only be connected to the [master node](#)<sup>[2083]</sup>, not to one of the [failover nodes](#)<sup>[2082]</sup>.

## Sensor

A sensor monitors one aspect of a [device](#)<sup>[2082]</sup>. For example, monitoring if a device responds to a Ping request is done by one sensor. Monitoring the traffic of one ethernet port of a router device is done by another sensor. For monitoring the CPU load of the local system yet another sensor is set up, and so on. A sensor's data is shown in [channels](#)<sup>[2081]</sup>.

## Sensor Tree

Sometimes used as synonym for [device tree](#)<sup>[2082]</sup>.

## Tickets

[Tickets](#)<sup>[149]</sup> are created by the system or a PRTG user and contain important messages or action steps to take for the administrator or another specific user. Every ticket should be viewed to take appropriate actions. You can access the list of tickets from the main menu.

## xFlow

Paessler designates all kinds of flow protocols as xFlow. Currently, PRTG supports NetFlow V5 and V9, sFlow V5, and jFlow V5.

## 13.2 List of Abbreviations

In the following, please find a list of the most common abbreviations used in this documentation.

ADO: ActiveX Data Objects (ADO)

ADSL: Asymmetric Digital Subscriber Line (ADSL)

AJAX: Asynchronous Java Script and XML (AJAX)

API: Application Programming Interface (API)

CoS: Class of Service (CoS)

CSV: Comma Separated Values (CSV)

DHCP: Dynamic Host Configuration Protocol (DHCP)

DMZ: Demilitarized Zone (DMZ)

DSCP: Differentiated Services Code Point (DSCP)

DNS: Domain Name Service (DNS)

GUI: Graphical User Interface (GUI)

GUID: Globally Unique Identifier (GUID)

HTTP: Hypertext Transfer Protocol (HTTP)

ICMP: Internet Control Message Protocol (ICMP)

IMAP: Internet Message Access Protocol (IMAP)

IPsec: Internet Protocol Security (IPsec)

JSON: JavaScript Object Notation (JSON)

LAN: Local Area Network (LAN)

LDAP: Lightweight Directory Access Protocol (LDAP)

MoID: Managed Object ID (MoID)

MIB: Management Information Base (MIB)

MOS: Mean Opinion Score (MOS)

NAT: Network Address Translation (NAT)

NTLM: NT LAN Manager (NTLM)

PDF: Portable Document Format (PDF)

PDV: Packet Delay Variation (PDV)

POP3: Post Office Protocol version 3 (POP3)

QoS: Quality of Service (QoS)

RADIUS: Remote Authentication Dial-In User Service (RADIUS)

REST: Representational State Transfer (REST)

RMON: Remote Monitoring (RMON)

RPC: Remote Procedure Call (RPC)

SASL: Simple Authentication and Security Layer (SASL)

SLA: Service Level Agreement (SLA)

S.M.A.R.T.: Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.)

SMB: Server Message Block (SMB)

SMTP: Simple Mail Transfer Protocol (SMTP)

SNMP: Simple Network Management Protocol (SNMP)

SNTP: Simple Network Time Protocol (SNTP)

SOAP: Simple Object Access Protocol (SOAP)

SPAN: Switched Port Analyzer (SPAN)

SQL: Structured Query Language (SQL)

SSH: Secure Shell (SSH)

SSL: Secure Sockets Layer (SSL)

TFTP: Trivial File Transfer Protocol (TFTP)

UNC: Uniform Naming Convention (UNC)

UPnP: Universal Plug and Play (UPnP)

UUID: Universally Unique Identifier (UUID)

VoIP: Voice over IP (VoIP)

VPN: Virtual Private Network (VPN)

WAN: Wide Area Network (WAN)

WBEM: Web-Based Enterprise Management (WBEM)

WMI: Windows Management Instrumentation (WMI)

WQL: Windows Management Instrumentation Query Language (WQL)

WSUS: Windows Server Update Services (WSUS)

XML: Extensible Markup Language (XML)

## 13.3 Support and Troubleshooting

Need help with PRTG? There are several ways to get support and trouble shooting.

### Video Tutorials

A video says more than a thousand words—watch tutorials for PRTG from Paessler and other PRTG users.

- [http://www.paessler.com/support/video\\_tutorials](http://www.paessler.com/support/video_tutorials)

### Paessler Knowledge Base

In the Knowledge Base you can search in hundreds of articles about PRTG. You can post your own questions and answers, too!

- <http://www.paessler.com/knowledgebase/>

### Open a Support Ticket

Users that have purchased a license can open support tickets which will usually be answered by Paessler's staff in less than 24 hours on business days.

- <http://www.paessler.com/support/openticket>

## 13.4 Legal Notices
